REPORT

TO

The Right Honourable GEORGE J. SHAW LEFEVRE, M.P.
President of the Local Government Board, &c. &c.

(1893.)

SIR,

I HAVE the honour to submit to you the following report on the marriages, births, and deaths registered in England and Wales during the year 1893.

POPULATION.

The population of England and Wales, as enumerated on 6th April 1891, consisted of 29,002,525 persons. The natural increase, by excess of births over deaths, from the beginning of April 1891 to the middle of 1893 amounted to 782,471, and this would raise the population to 29,784,996 at the latter date. Emigration and immigration, however, cannot be disregarded in estimating a population. In the absence of precise information concerning these points, the estimated populations published in the Annual Reports are based on the assumption that the rate of increase which prevailed in the last intercensal period has since been maintained—a method which, as was demonstrated in the 53rd Annual Report (*see* pp. v–vi), is not likely to lead to serious error when so large a population as that of the entire country is dealt with.

Thus estimated, the population in the middle of the year 1893 was 29,731,100, including 14,405,925 males and 15,325,175 females (Table 1). It is on this population that the rates for 1893 in the present report have been calculated.

MARRIAGES.

The number of marriages registered in the year 1893 was 218,689, corresponding to a rate of 14·7 persons married, per 1000 living. After 1886, when the marriage-rate was 14·2, which is the lowest on record, there was a gradual recovery for five years, the rate in 1891 reaching 15·6; in 1892, however, the rate declined to 15·4, and it further fell to 14·7 in 1893. The lowest marriage-rates per 1000 population in registration counties in 1893 were 11·2 in Middlesex, 11·4 in Hertfordshire, 12·2 in Buckinghamshire and in Essex, 12·5 in Oxfordshire and in the North Riding of Yorkshire, 12·6 in Huntingdonshire and in Westmorland, and 12·7 in Surrey; the highest rates were 15·1 in Staffordshire, 15·2 each in Gloucestershire, Warwickshire, and Nottinghamshire, 15·3 in Lancashire, 15·4 in the East Riding of Yorkshire, 15·5 in South Wales, and 17·2 in London. The highest and lowest marriage-rates in 1893 were generally in those counties which had also shown respectively the highest and lowest average rates during the preceding decennium.

The decline in the marriage-rate coincided, as usual, with a fall in the value of British exports, and in the amount per head of population cleared at the Bankers' Clearing House, and also with a fall in the price of wheat; the latter was reduced to 11·5 per cent. below the price in 1889, which, as shown in the following table, had been the lowest on record:

TABLE A.—MARRIAGE-RATE, VALUE of BRITISH EXPORTS and IMPORTS, PRICE of WHEAT, and amount cleared at the London Bankers' Clearing House, 1860–93.*

1893	14·7	5 13 6	10 10 7	17 14 9	26 4	218

* The figures in the marriage-rate column are not strictly comparable with those in columns 2, 3, and 4, inasmuch as the former relate only to England and Wales, whilst the latter relate to the whole of the United Kingdom. The figures relating to exports and imports and to the price of wheat are derived from the Board of Trade Statistical Abstracts; and those showing the amount cleared at the London Bankers' Clearing House (calculated upon the population of England and Wales) are derived from the same source.

Forms of Marriage.—Of the marriages contracted in 1893, 151,309 or 692 per 1000, were celebrated according to the rites of the Established Church, and 67,380, or 308 per 1000, otherwise. In the preceding five years, 1888–92, the mean proportions had been 699 and 301. Compared with the proportions in these five years, the proportions of marriages amongst Roman Catholics declined in 1893 from 42 to 41 per 1000, while those amongst other Christian non-conforming bodies rose slightly, viz., from 117 to 118. The gradual rise in the proportion of Jewish marriages, referred to in recent reports, was continued in 1893, the proportion being 5·1 per 1000, against a mean proportion in the preceding five years of 4·2.

First marriages; Re-marriages.—Of 1000 men married during the year 1893, 886 were bachelors, and 114 were widowers; while of 1000 women who married, 920 were spinsters and 80 were widows. The number of re-marriages, as compared with that of first marriages, had declined almost continuously from 1876 to 1891, in which latter year the proportions both of widowers and of widows who re-married stood at the lowest figures then on record (Table 7). In 1892 the proportions of widowers and widows had both slightly increased; this increase was not, however, maintained in 1893, when the proportion of widowers fell to the same level as in 1891, and that of widows to a still lower level than in that year. The number of persons married in 1893 who were described in the register as having been previously divorced, and who in the above proportions are included among the bachelors and spinsters, was 201, including 93 men and 108 women. This total exceeded that recorded in any of the preceding eight years, in which the numbers varied from 150 to 190. Of the 93 divorced men, 71 married spinsters, 16 married widows, and 6 married divorced women. Of the 108 divorced women, 74 married bachelors, 28 married widowers, and 6 married divorced men.

Ages at Marriage.—In regard to 5028, or 2·3 per cent., of the marriages, the age of one or other of the contracting parties was omitted from the register. Of the remaining 213,661 couples, whose ages were stated, the mean ages were 28·51 years for men and 26·23 years for women. The mean age of bachelors who married was 26·55, of widowers 44·61, of spinsters 25·04, and of widows 40·64 years. The mean age at marriage has been steadily rising ever since 1873, the mean age for each group in 1893 being the highest on record. Further evidence that marriage is now deferred to a somewhat later period of life than formerly is afforded by the decline in the proportion of under-age marriages. In the earlier years of civil registration the proportions of those who married before attaining 21 years of age were less than 50 in 1000 for men, and less than 150 in 1000 for women. The proportions went on increasing steadily, until in 1874 they reached their highest points, viz., 84 in 1000 for men and 227 for women; the proportions then began steadily to decline, and they have continued to do so almost uninterruptedly, the figures in 1893 standing at 56 for men, and 181 for women. (Table 7).

The registration counties which showed the highest proportions of under-age marriages among men in 1893 were Nottinghamshire, Bedfordshire, Leicestershire, Staffordshire, and Northamptonshire, these counties having also shown the highest average proportions in the decennium 1883–92. The counties with the highest proportions of under-age marriages among women in 1893 were Durham, Nottinghamshire, Staffordshire, Monmouthshire, Derbyshire, Leicestershire, the three Ridings of Yorkshire, and Essex, the highest average proportions in the preceding decennium having also occurred in these counties.

Scarcely less agreement between the figures for 1893 and those for the previous decennium was shown by the lowest proportions of under-age marriages; in both periods there were very low proportions of these marriages among men in North Wales, Surrey, Herefordshire, Shropshire,

Rutlandshire, and Westmorland, and among women in North Wales, Herefordshire, Shropshire, and Westmorland. It is plain, therefore, that the comparative frequency of early marriages in different counties is not merely a temporary phenomenon, but is one depending on persistent causes.

Signature in Marriage Register.—The men who signed the marriage register with marks instead of writing their names were in the proportion of 50 in 1000, while the similarly illiterate women were 57 in 1000. In 16 out of 1000 marriages both bridegroom and bride used that form of signature. With the progress of elementary education there has been a continuous diminution in the proportions of both men and women signing with marks; in 1893 the proportions, as compared with those in 1892, showed a reduction of 10·7 per cent. for men and of 13·6 per cent. for women.

Buildings registered for the Solemnization of Marriages.—At the end of the year 1893 there were 15,122 churches or chapels belonging to the Established Church in which marriages could be solemnized, showing an increase of 30 upon the number at the end of the previous year. There were also 11,249 buildings registered for marriage by rites other than those of the Established Church, showing an increase of 251, or 2·3 per cent., upon the number on the register at the end of 1892. (Table 9.)

Certified Places of Worship.—The number of new buildings certified in 1893 for religious worship under the provisions of the Acts 15 & 16 Vict. c. 36. and 18 & 19 Vict. c. 81. was 552, while 101 buildings already certified were removed from the register by cancellation; the number of certified buildings recorded in the register at the end of the year was 28,218. It is more than probable, however, that some of these buildings are no longer used for worship, though the necessary steps have not yet been taken to remove them from the register by cancellation.

Births.

The births registered during the year numbered 914,542, and were in the proportion of 30·8 per 1000 persons living. The mean annual birth-rate had been 31·9 in the ten years 1883–92; compared with this average the rate in 1893 therefore showed a deficiency of 1·1 per 1000.

As predicted in the last Annual Report, there was a further slight recovery in the birth-rate in 1893; the rate for this year being 30·8, against 30·5 in the preceding year. With the exception, however, of the rates in 1890 and 1892, which were 30·2 and 30·5 respectively, the rate in 1893 was the lowest yet recorded.

The registration counties showing the highest birth-rates were again amongst the mining and industrial counties, the rates being 32·3 in Lancashire, 33·3 in Nottinghamshire, 33·7 in Northumberland and in Derbyshire, 35·4 in South Wales, 35·5 in Monmouthshire, 36·0 in Staffordshire and 36·2 in Durham. On the other hand the lowest rates, in no case exceeding 27·0, were in Rutlandshire, Sussex, Surrey, Huntingdonshire, Dorsetshire, Westmorland, Devonshire, and Bedfordshire. (Table 10.)

Sex.—The births of males numbered 465,692, and the births of females 448,850, the former being to the latter in the proportion of 1038 to 1000, against an average proportion of 1037 to 1000 in the previous decennium.

In registration counties the highest proportions of male births to 1000 female births were 1138 in Westmorland, 1089 in Dorsetshire, 1081 in Oxfordshire, 1070 in the East Riding of Yorkshire, 1068 in Sussex, and 1066 in Berkshire; while the lowest proportions were 921 in Rutlandshire, 995 in Gloucestershire, 1008 in Essex, 1009 in Huntingdonshire, 1010 in Monmouthshire, and 1012 in Cumberland.

Illegitimate Births.—The infants registered as born out of wedlock numbered 38,858: they were in the proportion of 42 per 1000 births, and of 1·3 per 1000 persons living, these proportions being identical with the proportions in the previous two years, which are lower than any previously recorded. (Table 2). In registration counties the highest proportions of illegitimate to total births were 64 per 1000 in the North Riding of Yorkshire, 66 in North Wales, 68 in Westmorland, 70 in Cumberland, 73 in Herefordshire, and 74 in Shropshire. The lowest county proportions were 28 in Essex, 29 in Monmouthshire, 32 in Middlesex, 35 in South Wales, and 37 in Warwickshire and in Durham.

Deaths.

The deaths registered in England and Wales during the year 1893 numbered 569,958, being in the proportion of 19·2 to 1000 persons living. This rate was 0·2 per 1000 higher than the rate in the preceding year, but was identical with the mean annual rate in the ten years 1883–92.

The lowest death-rates in registration counties were 14·7 in Westmorland, 15·0 in Berkshire, in Buckinghamshire, and in Dorsetshire, 15·1 in Rutlandshire, 15·4 in Middlesex, and 15·6 in Surrey, in Oxfordshire, and in Cambridgeshire; while the highest were 20·5 in Durham, 20·7 in the East Riding of Yorkshire and in Staffordshire, 20·8 in London, and 22·4 in Lancashire. (Table 10.)

Sex.—The 569,958 deaths included 291,889 of males and 278,069 of females. The death-rate among males was 20·3, and that among females 18·1, per 1000 living of the corresponding sex. Out of equal numbers living there were 1117 deaths of males to 1000 deaths of females, as compared with an average proportion in the decennium 1883–92 of 1122 to 1000. (Table 2.)

Ages.—On reference to Tables 11 and 12 it will be seen that the death-rates of males in the age-groups under 55 years, and of females in those under 45 years were somewhat higher in 1893 than in the previous year; while at the more advanced ages the mortality of both sexes declined, chiefly on account of the diminished prevalence of influenza in 1893. Compared with the average annual death-rates in the 10 years 1881–90, the rates in 1893, for both males and females, were either the same or lower at age-groups between 5 and 35 years, and above 75 years; while the mortality was higher at the age-groups between 35 and 75 years, and also at the age-group under 5 years. Compared, however, with the low rates which had been reached in 1888 and in 1889, the rates in 1893 showed excess in all the age-groups below 85 years.

Infantile Mortality.—The infantile death-rate, or proportion of deaths of infants under one year of age to registered births, was 159 in a thousand, and higher than in any year since 1870, when the proportion had been 160 in 1000. The exceptionally high rate in 1893 was mainly due to heavy mortality from diarrhœa; for, while the average annual mortality from all causes among infants under one year of age per 1000 births rose from 144 in the ten years 1883–92 to 159 in 1893, the part of this mortality attributed to diarrhœa rose from 13 in the ten years 1883–92 to 22 in 1893. The average mortality of infants from all causes in the four decennia ending with 1890 had been in the proportions of 154, 154, 149, and 142, respectively, to 1000 births. (Table 18.)

Urban and Rural Mortality.—Compared with the mortality in the previous year, the death-rate among the urban population rose in 1893 from 19·5 to 20·2 per 1000, while the rate among the rural population

declined from 18·1 to 17·4 per 1000. The death-rate in the urban population, compared with that in the rural population, was in the proportion of 116 to 100, which exceeded the proportion in each of the previous two years, but was slightly below the average proportion in the decennium 1881–90. The increased excess of the urban over the rural death-rate in 1893, as compared with the rates in 1891 and 1892, was in part due to the high mortality from diarrhœa, a disease affecting town in greater degree than country populations. The rates in 1891 and 1892, however, in the rural districts had been unusually high, doubtless on account of epidemic influenza, thus reducing the difference between the urban and rural rates, so that in 1893 the ratio of urban to rural mortality only reverted to its normal figure. This is especially shown by comparison of the death-rates in the first quarter of each of the years 1892 and 1893, for whereas in that period of the former year the rate in the rural districts had been 25·5 per 1000, and not less than 5·2 per 1000 above the average of the corresponding quarters in the previous decennium, it fell in 1893 to 18·4, or 1·9 per 1000 below the same average.

Registered Causes of Death.

The deaths, when distributed to the several classes by their assigned causes, were equivalent to the rates shown in the following table:—

Table B.—Annual Rate of Mortality, per 1,000,000 Living, from the several Classes of Diseases.

Year.	All Causes.	Zymotic Diseases.	Parasitic Diseases.	Dietetic Diseases.	Constitutional Diseases.	Developmental Diseases.	Local Diseases.	Violence.	Ill-defined and not specified Causes.

Zymotic or Specific Febrile Diseases.—The deaths ascribed to this class of disease in the year 1893 numbered 94,126, and were in the proportion of 3165 to a million persons living; which exceeds the proportion in any year of the decennium 1883–92. The mortality directly attributed to influenza, which in the year 1891 had attained its maximum, namely 574 per million, and had fallen to 534 in the following year, further fell to

325 in the year 1893. As compared with the average of the preceding ten years there was in 1893 a decrease in the mortality from measles, scarlet fever, and whooping-cough, whilst there was an increase in that from small-pox and enteric fever, and a very serious increase under the heads of diphtheria and diarrhœa.

It was stated in the last Report that after three years of practical immunity from *small-pox*, the deaths in 1892 had suddenly risen to 431, or 15 per million living. In the year 1893 the deaths from this disease further rose to 1457, and corresponded to a rate of 49 in each million persons living. Of the 1457 persons who died from this disease only 150, or 10·3 per cent., were described as having been vaccinated (against 12·8 per cent. in the preceding year); 253, or 17·4 per cent., were returned as not vaccinated, and with respect to 1054, or 72·3 per cent., no statement as to vaccination appeared in the certificates. In addition to the above, 127 deaths were attributed to chicken-pox, and 59 deaths to "effects of vaccination." Thus the total number of deaths either certainly or possibly caused by variola, and of deaths alleged to have been caused by the means taken to prevent that disease, during the year 1893, was 1643, or 55 per million persons living.

The deaths from *measles* in the year 1893 numbered 11,110, and were equal to a rate of 374 per million persons living. This rate is lower than the rate in either of the preceding four years. It is less by 86 per million than the rate in 1892, and less by 80 per million than the average rate in the ten years 1883–92. There was a marked decline in London, the rate falling from 799 per million in the preceding year, to 384 per million in 1893; and this decline may fairly be regarded as the cause of the decreased rate in the country as a whole during 1893, for the death-rate in the remainder of England and Wales, excluding London, was practically the same in 1893 as it had been in 1892.

The mortality, however, differed widely in various parts of the country, for while it did not reach 100 per million in Huntingdonshire, Bedfordshire, Cambridgeshire, Herefordshire, Rutlandshire, or Nottinghamshire, it was as high as 415 in Buckinghamshire, 418 in the East Riding of Yorkshire, 443 in Hampshire, 456 in South Wales, 484 in the West Riding of Yorkshire, 493 in Cumberland, 638 in Northumberland, 642 in Monmouthshire, 657 in Staffordshire, and 685 in Lancashire.

In a few other counties, viz., Berkshire, Suffolk, Norfolk, Wiltshire, Cornwall, and Somersetshire, the mortality from measles was higher in 1893 than it had been in the previous year; in all these cases, however, the rates in 1893 were below the rate for the whole country.

Scarlet fever.—The deaths from scarlet fever numbered 6982, and were equal to a rate of 235 per million of the population. This rate is higher than the rates both in 1891 and in 1892, which had been 171 and 190 respectively. It is, however, considerably below the mean rate in the ten years ending with 1892, which had been 267.

The year 1893 is the ninth consecutive year in which the deaths from scarlet fever in England and Wales have been fewer than 8000, the average number in the nine years having been 6423, and the average rate 226 per million. The lowest previous rate since 1838 had been 402 per million in the year 1884.

The highest county death-rates from scarlet fever in 1893 were 308 per million in Lancashire, 316 in Monmouthshire, 329 in London, 355 in Nottinghamshire, 356 in Herefordshire, 375 in Leicestershire, 467 in Middlesex, and 521 in Cornwall; of these eight counties, Monmouthshire, London, and Leicestershire had also shown excess in 1892, while the death-rate from scarlet fever in Lancashire had exceeded that for the whole country in every year since 1882.

Of 1596 deaths from scarlet fever which were registered in 1893 in London and in the Metropolitan Asylum Hospitals situated outside London, 921, or 58 per cent., occurred in public Institutions, against 807, or 69 per cent. of the total deaths similarly reckoned, in 1892. The reports of the Metropolitan Asylums Board show that the mortality amongst cases treated in the Hospitals under their control was 6·11 per cent. in 1893, against an average of 8·35 per cent. in the six years 1887–1892.

Enteric (*Typhoid*) *Fever.*—In the Registrar-General's 55th Annual Report, attention was directed to the unprecedentedly low enteric fever mortality in the year 1892, when the rate did not exceed 137 per million persons living, which is the lowest rate on record. The prediction hazarded in that report, on the strength of the quarterly returns furnished by the local Registrars, namely, that a very large increase in enteric fever mortality would be found to have occurred in 1893, is confirmed by the figures in the present Report. The deaths from enteric fever in that year numbered 6801, and corresponded to a rate of 229 per million persons living, against a mean rate of 184 in the decennium 1883–92. The rate in 1893 was higher than that in any previous year since 1884, when the mortality amounted to 236 in a million.

The increase in mortality from this disease was general throughout almost the whole of England and Wales; Berkshire, Buckinghamshire, Wiltshire, Devonshire, and Worcestershire being the only counties in which the rate in the year 1893 did not exceed that in 1892. The counties which showed, in 1893, the largest excess, as compared with their respective averages in the preceding 10 years were Rutlandshire, Sussex, Durham, the East Riding of Yorkshire, Dorsetshire, Lincolnshire, Herefordshire, Bedfordshire, Cornwall, Warwickshire, and Cheshire, the great increase in Sussex, which amounted to 282 per cent. of the mean rate, being mainly due to the epidemic at Worthing. The following 10 counties showed the highest rates in 1893:—

South Wales, 252.
West Riding, 264.
*Cheshire, 294.†
Lincolnshire, 295.†
*Nottinghamshire, 317.†
*Lancashire, 320.†
North Riding, 326.
Sussex, 443.†
*East Riding, 487.†
*Durham, 565.†

In addition to the 10 counties named above as showing the highest enteric fever rates in 1893, three other counties, namely, Essex, Staffordshire, and Leicestershire, had rates in excess of the mean rate in England and Wales in that year.

In the last three reports of the Registrar-General, a table has been given showing the rates of enteric-fever mortality from the year 1890 onwards, in a group of 18 registration districts, extending from Morpeth to Middlesbrough and Guisborough, which have suffered severely from enteric fever in recent years. It will be useful to continue that table here.

TABLE C.—MORTALITY from ENTERIC FEVER in a GROUP of 18 REGISTRATION DISTRICTS, 1890–93.

Year.	Deaths.	Rates per Million.
1890 - - -	601	395
1891 - - -	465	301
1892 - - -	285	181
1893 - - -	766	480

* Showed also one of the highest county rates in each of the two preceding years.
† Higher than the rate in any of the 19 years 1883–92.

It thus appears that the mortality in this group of districts, which had been rapidly falling during the three years 1890–1–2, showed an abrupt and very serious rise in the year 1893. The rate in each of the 18 districts showed an increase, as will be seen in Table D., but the largest increases were in Darlington, Auckland, Easington, Houghton-le-Spring, Chester-le-Street, and Sunderland.

TABLE D.—MORTALITY from ENTERIC FEVER.

Morpeth - - - -	310	258	347	456	344

Diphtheria was the assigned cause of death in 9,466 instances during the year 1893. These deaths were equal to a rate of 318 per million living, a higher rate than in any previous year on record with the exception of 1858 and 1859, in which years the rates had been 339 and 517 respectively. The rate in 1893 was 82 per cent. in excess of the average rate in the ten-year period 1883–92, which had been 175 per million. Taking diphtheria and "croup" together the deaths in 1893 amounted to 11,568, or 389 per million, exceeding the rate in the previous year by 91 per million living.

All the county rates from diphtheria except the rates for Huntingdonshire, Dorsetshire, Nottinghamshire, Northumberland, and North Wales exceed their decennial averages.

In 34 counties the rates were lower than the general rate in England and Wales, the excessive diphtheria mortality being limited to comparatively few counties, especially to London, Surrey, Kent, Sussex, Middlesex, Buckinghamshire, Oxfordshire, Essex, Suffolk, and Wiltshire, which counties, with the exception of the last named, form a continuous area closely corresponding with what has been described in previous Reports as the South-Eastern diphtheritic region. The mortality from diphtheria in the ten counties above enumerated was 612 per million living, while in the

remaining thirty-five counties of England and Wales the mean rate did not exceed 197 per million.*

The deaths from *whooping-cough* numbered 10,176 and corresponded to a rate of 342 in a million living. The rate in 1893 from this disease showed a considerable decline from the rates in the three preceding years, which had been 478, 468, and 455 respectively. It was the lowest rate on record, the nearest approach having been 389 per million in the year 1840.

In each of fourteen counties, mostly agricultural in character, namely, Sussex, Bedfordshire, Suffolk, Norfolk, Wiltshire, Dorsetshire, Devonshire, Herefordshire, Warwickshire, Leicestershire, Rutlandshire, the North Riding of Yorkshire, Cumberland, and North Wales, the rate in 1893 showed an increase upon that in 1892, although in only nine of those counties did the rates in 1893 exceed the respective decennial averages, and in five of them, namely, Sussex, Bedfordshire, Devonshire, Herefordshire, and Rutlandshire, the rates in 1893 were below the rate for the whole country. In the remaining thirty-one counties the rates in 1893 were below their decennial averages; although in six of them, viz., in London, Essex, Derbyshire, Cheshire, Lancashire, and Durham the rates in 1893 exceeded the rate in England and Wales.

Influenza.—Although in most parts of the country there was a great decrease in influenza mortality during 1893 as compared with the three preceding years, nevertheless, in some parts of England and Wales, and notably in the Metropolis, the disease was still fatally prevalent.

The deaths in England and Wales specially referred to influenza during 1893 numbered 9669, as against 4523, 16,686, and 15,737 respectively in the years 1890–1–2.

If for the reasons stated in the last Report we again take the year 1889 as a standard of comparison,† we find the combined mortality from influenza and respiratory diseases to have been as shown in table E.

Continuing the estimate of the probable loss of life due to influenza according to the principle adopted in the last Report, and for the reasons there stated, we find that the excess of mortality, or in other words the loss of life actually due to influenza, in England and Wales, during 1893, was about 15,000, which being added to the 110,000 lives lost in the three previous years, makes an aggregate loss of not fewer than 125,000 lives in the four years 1890–1–2–3. Thus to every 3 deaths directly attributed to influenza in these four years about 5 more deaths really caused by the disease were returned as due to various diseases of the respiratory organs.

---

* Counties with highest Diphtheria death-rates in the year 1893.

London	758 per million.	Wiltshire	429 per million.
Essex	557 ,,	Suffolk	425 ,,
Surrey	542 ,,	Oxford	422 ,,
Sussex	473 ,,	Middlesex	413 ,,
Kent	433 ,,	Buckingham	367 ,,

Counties with lowest Diphtheria rates in 1893.

Staffordshire	114 per million.	Northumberland	132 per million.
Nottinghamshire	115 ,,	Cumberland	133 ,,
Huntingdonshire	121 ,,	Worcestershire	134 ,,
East Riding	130 ,,	Derbyshire	135 ,,

† The year 1889 was adopted in the 55th Annual Report, p. xv, as a standard for comparison, both because it may be regarded as a year of approximately normal mortality and because it immediately preceded the first outbreak of influenza.

TABLE E.—MORTALITY per 1000 living, attributed to INFLUENZA and DISEASES of the RESPIRATORY ORGANS, in the 5 Years 1889–93.

—	Rates per 1000 in each Year.					Excess in 1890-1-2-3, the rates in 1889 being taken as Standard.

The heaviest incidence of influenza in the course of 1893 was in the Metropolitan area, where the deaths attributed to that disease numbered 1513, and were equal to a rate of 351 per million. Of these 1513 deaths nearly half were registered in the fourth quarter, and not fewer than 546 within the last four weeks of the year. Towards the close of 1893, therefore, it appeared from the figures then available as though London were on the eve of yet another severe recrudescence of this disease. Subsequent returns, however, show that by the end of the sixth week of 1894 the weekly influenza deaths had again fallen to 19 in number.

With regard to the excessive mortality in 1893, attributed to diseases of the respiratory system in London, it is worthy of note, as showing that this excess was not due to its ordinary cause, namely, great or prolonged depression of temperature, that the deaths referred to bronchitis, which is the respiratory disease specially influenced by variations of temperature, were more than 7 per cent. *below* the average, whilst those referred to pneumonia were 35 per cent. *above* the average, of the preceding 10 years. If we compare the mortality in 1893 with that in the year 1889, which immediately preceded the influenza period, it will be seen that, after allowing for increase of population, the mortality from pneumonia showed an excess of 65 per cent., while that from bronchitis showed an excess of less than 10 per cent.

Diarrhœal complaints (diarrhœa, dysentery, and cholera) accounted for 29,721 deaths during the year, these deaths being in the proportion of 999 per million living, against an average proportion of 653 in the ten years 1883–92. The rate from these diseases last year exceeded the decennial average by as much as 53 per cent., and was the highest rate recorded in any year since 1884. Only four times in the past 20 years has the mortality from these diseases exceeded that in 1893. In Oxfordshire, Wiltshire, Dorsetshire, Somersetshire, Herefordshire, and Rutlandshire the rates in 1893 from diarrhœal diseases ranged from 263 to 328 per million living, while they reached 1300 in the West Riding of Yorkshire, 1447 in Leicestershire, 1471 in Durham, 1488 in Warwickshire, 1623 in Lancashire, and 2001 in the East Riding of Yorkshire.

Although in the country generally the excess in the death-rate from diarrhœal diseases was 53 per cent., the rates in London, Berkshire, Oxfordshire, Dorsetshire, and Shropshire, differed but slightly from their

respective averages. The *excess*, however, was more than 100 per cent. in Cornwall, Lincolnshire, Cheshire, and the East and North Ridings of Yorkshire.

Only 4 deaths were referred to *hydrophobia*, showing a further decline from the numbers recorded in either of the four preceding years, which had been 30, 8, 7, and 6 respectively. The deaths were fewer in 1893 than they had been in any year since 1863; the annual average in the 29 years 1864–92 having been 32.

To *puerperal fever* 3023 deaths were referred in 1893, and to other *accidents of childbirth* 2927. These deaths numbered 5950 in the aggregate, and were equal to a mortality of 6·51 to 1000 registered births, a further increase upon the rates in the preceding four years, which had been 4·05, 4·89, 5·24, and 5·78 respectively. The rate in 1893 was higher than that in any previous year since 1876, in which year it had been 5·95 per 1000.

Parasitic Diseases.—The deaths referred to parasitic diseases numbered 577, of which 434 were attributed to thrush, and the remainder to "other parasitic diseases." The deaths from diseases of this class were fewer than in any previous year on record.

Dietetic Diseases.—2610 deaths were returned under this heading in 1893, being equal to a rate of 88 per million of the population, against an average rate of 68 in the preceding decennium. The deaths directly ascribed to intemperance numbered 2174, or 73 per million, which is the highest rate on record; the rates in the three preceding years had been respectively 70, 71, and 67 per million. (Table 16.)

Constitutional Diseases.—95,389 deaths, or 3210 in each million persons living, were referred to one or other of the diseases in this category. The deaths from cancer numbered 21,135, and corresponded to an annual rate of 711 in a million. For many years prior to 1892 there had been a progressive increase in cancer mortality. In 1892, however, the rate showed a trifling decline, namely, from 692 to 690; but in 1893 the rate rose again to 711 in a million, and was higher than in any previous year on record. The deaths from phthisis were 43,632, and were equal to a rate of 1468 in a million, which is identical with the rate in the preceding year. Up to the year 1888 the mortality from phthisis had shown a steady decline for many years, but in 1889, 1890, and 1891 it rose somewhat. In 1892 and 1893, however, the rate again fell to 1468 in a million, which is the lowest rate on record. Diabetes was returned as the cause of 2082 deaths, which corresponded to a rate of 70 in a million, and showed a further increase on the rates in recent years.

Developmental Diseases accounted in the aggregate for 47,359 deaths, or 1593 in a million persons living. The deaths referred to "old age" numbered 26,528, or 892 in a million, against 1011 and 944 respectively in the previous two years. As was mentioned in the last Report the mortality from premature birth and congenital defects has shown in recent years a constant tendency to increase. The mortality in 1893 from premature birth was equal to 18·88, and that from congenital defects to 3·90 per 1000 children born, showing a still further increase on the high rates prevailing in recent years, as shown in the following Table.

TABLE F.—PREMATURE BIRTHS and CONGENITAL DEFECTS. DEATHS to 1000 BIRTHS, 1861–93.

Year.	Premature Births.	Congenital Defects.
1861–65 - -	11·19	1·76
1866–70 - - -	11·50	1·84
1871–75 - -	12·60	1·85
1876–80 - - -	13·38	2·39
1881 - - -	13·63	3·20
1882 - - -	13·99	3·31
1883 - - -	14·45	3·08
1884 - - -	14·42	3·15
1885 - - -	14·43	3·41
1886 - - -	15·09	3·33
1887 - - -	15·89	3·29
1888 - - -	15·98	3·45
1889 - - -	16·30	3·41
1890 - - -	17·48	3·46
1891 - - -	18·00	3·60
1892 - - -	18·46	3·83
1893 - - -	18·88	3·90

Local Diseases.—To this class 283,546, or 49·7 per cent. of the total deaths were assigned in the year 1893. These deaths were equal to a rate of 9536 in a million living, which showed a further decline from the exceptionally high rates in 1890 and 1891. The rate was also below the average in the preceding ten years. (Table B.) The deaths from diseases of the respiratory system (exclusive of croup), numbered 105,145, and were in the proportion of 3536 in each million living, as compared with 3,731, the average rate in the decennium 1883–92. Diseases of the nervous system, exclusive of convulsions, were responsible for 47,903 deaths, corresponding to a rate of 1612 in a million, which is the lowest rate recorded in any year since 1868. To diseases of the circulatory system, 48,458 deaths, or 1630 in each million living, were attributed. This rate is lower than that in any previous year since 1885, and 23 in a million below the mean rate in the ten years 1883–92. The deaths from diseases of the urinary system amounted to 13,420 or 451 per million living, being almost identical with the mean rate in the decennium 1883–92, which had been 449 in a million.

Violence.—The deaths referred in 1893 to accident or negligence numbered 17,124, and were equal to a rate of 576 per million of the population, or somewhat above the average in the previous decennium, which had been 555. The deaths ascribed to suicide were 2,599, being in the proportion of 87 per million, against 85 and 88 per million in the preceding two years. Under the heading homicide were classed 337 deaths, the rate of mortality being 11 per million. In 195 of these cases the verdict was murder, and in 142 cases manslaughter, the latter including two cases of justifiable homicide. There were 16 executions in the course of the year.

Ill-defined and Unspecified Causes.—In 26,275 cases, or 4·6 per cent. of the total deaths, the cause of death was so unsatisfactorily stated as to be useless for purposes of scientific classification—the deaths are therefore referred to this heading. The average proportion in the ten years 1883–92 had been 5·1 per cent.. The reduction in the proportion of these un-

satisfactory returns was probably in great measure due to the issue from this Office in recent years of a large number of letters of inquiry addressed to medical men concerning doubtful or obscure certificates of the cause of death. The number of such letters in 1893 was 4452, the result being the transference of a large number of deaths from indefinite to definite headings; for example, 541 deaths were removed from more or less vague headings to cancer (or malignant disease), 105 to syphilis, and 219 to puerperal fever and other accidents of childbirth.

Certification of Causes of Death.—Of the 569,958 deaths registered during the year 1893, the causes of 522,783, or 91·7 per cent., were certified by registered medical practitioners, and the causes of 32,839, or 5·8 per cent., by coroners after inquest, while the causes of the remaining 14,336 deaths, or 2·5 per cent., were not certified. The 14,336 uncertified cases included deaths of infants who had been attended only by midwives, and those of persons attended by unregistered practitioners, as well as those of persons who had received no medical attendance of any kind in their last illness. In registration counties the proportions per cent. of uncertified deaths ranged from 0·7 in Middlesex, 0·9 in London, and 1·0 in Wiltshire, to 4·2 in Warwickshire, 4·6 in Huntingdonshire, 5·5 in North Wales, 5·6 in Herefordshire, and 5·7 in Westmorland. Among counties in which the proportion of uncertified deaths was greater in 1893 than it had been in 1892 were Sussex, Buckinghamshire, Leicestershire, and Westmorland; while considerable decrease was shown in Somersetshire, Nottinghamshire, Derbyshire, and Yorkshire.

Offences against the Registration Acts.—In 1893, 23 persons, on prosecution by order of the Registrar-General, were convicted of different offences against the Registration Acts, as under :—

For giving false information for registration - -	17
For making and giving false certificates of cause of death - - - - - -	3
For burying as still-born a child born alive - -	1
For giving a false declaration of still-birth - -	1
For otherwise procuring illegal burial - -	1

PROGRESS OF REGISTRATION.

The names in the alphabetical indexes of births, deaths, and marriages recorded in the national registers of England and Wales were increased in the year 1893 by 1,921,878, this addition raising the aggregate number of names in the indexes, which at the end of 1893 embraced a period of 56½ years, to 87,053,427. The number of searches during 1893 in the various registers was 50,626, being 316 fewer than the number in the previous year. The number of certificates issued was 34,117, showing a decrease of 561 from the number in 1892. The fees received for searches and certificates in 1893, and paid into Her Majesty's Exchequer, amounted to 6,845*l.* 6*s.* 6*d.*, or 76*l.* 8*s.* 6*d.* less than in the previous year. (Table 26.)

A list of the various public registers and records lodged in the General Register Office, Somerset House, was published in the 34th Annual Report, pages xxi–xxii.

Mortality in the Army.*

The average strength of the Army at home and abroad in 1893 was 217,279, and the deaths were 1803, the rate of mortality thus being 8·3 per 1000, against 8·9 and 9·1 in the preceding two years. The mortality in the Army abroad was 10·9 per 1000, which was 1·6 per 1000 below the mean rate in the three years 1890–92; while that in the Army at home was 5·5 per 1000, against 5·4 and 4·7 in the preceding two years. (Table 29.)

Mortality in the Navy.†

The average force afloat in 1893 was 60,120. The deaths were 679, being in the proportion of 11·29 per 1000 of the strength. Of the 679 deaths, 245 were due to disease, and 434 to violence; the death-rate from disease was therefore 4·07 per 1000, and that from violence 7·21 per 1000. Of the 434 deaths from violence 392 resulted from drowning, (including 358 by the sinking of the "Victoria") 2 from heatstroke, 35 from other accidental causes, and 5 from suicide.

Births and Deaths of British Subjects at Sea.

Marine Register Book.—In accordance with the Births and Deaths Registration Act of 1874, commanding officers of ships trading to or from British ports are required, under penalty, to transmit returns of all births and deaths occurring on board their ships to the Registrar-General of Shipping and Seamen, who furnishes certified copies of such returns to the Registrars-General of England, Scotland, and Ireland. Similar returns are furnished by persons having charge of Her Majesty's Ships directly to the Registrars-General of Births and Deaths. These returns of births and deaths at sea constitute the "Marine Register Book." The entries of births and deaths of persons other than those stated to be of Scotch or Irish origin, reported to this Office, numbered respectively 189 and 3288 in the year 1893. Of the 3288 deaths, so far as could be judged by the entries, which are not always very precise, 1234 were of persons of English origin, while 139 others were of persons described simply as of British origin.

Mercantile Marine.—The Registrar-General of Shipping and Seamen reports that the number of masters and seamen afloat during the year 1893 in vessels belonging to the mercantile marine of the United Kingdom (including the islands in the British seas), and registered under the Merchant Shipping Acts, was 240,974, being 761 fewer than in the preceding year. The reported deaths numbered 3172, showing a rate of 13·1 per 1000 of the strength. This rate was 0·7 per 1000 below the mean rate in the five years 1888–92, and was identical with the rate in 1889, which had been the lowest rate on record. (Table 31.)

Among *passengers* on board merchant vessels at sea 78 births and 420 deaths were reported in 1893, the births exceeding by one, and the deaths exceeding by eight, the numbers recorded in the preceding year. (Table 32.)

International Vital Statistics.

In Tables 39–56 will be found international statistics concerning the marriages, births, and deaths, in most of the European States.

---

* Based upon returns furnished by His Royal Highness the Commander-in-Chief.

† Based upon returns furnished by the Director-General of the Medical Department of the Navy.

A comparison of the death-rate in 1893, in each country from which a return was received, with the death-rates in preceding years shows that the mortality was generally somewhat below that of recent years, particularly in Hungary, in the Netherlands, in Belgium, and in Italy; but Switzerland and the German Empire experienced a slightly increased mortality.

In previous reports it has been pointed out that as the sex and age distribution of the population varies greatly in different countries, and as the rates largely depend on such distribution, the rates in one country cannot safely be compared with the rates in another, without correction for this difference in the constitution of the several populations.

In order to allow of fair comparison, it is most desirable that the several countries should agree upon some "Standard population," that is to say, a population with fixed age and sex distribution, for international use; so that the birth, marriage, and death rates for each country may be calculated by this standard. I again commend this suggestion to the notice of the respective Governments.

I have the honour to be,
Sir,
Your faithful Servant,
BRYDGES P. HENNIKER,
Registrar-General.

General Register Office, Somerset House,
5th December, 1894.

Remarks on the Meteorology of the Year 1893.*

By James Glaisher, Esq., F.R.S., &c.

The following remarks, both with regard to atmospheric pressure and temperature, are based on observations made near London, but they may be taken as having a general application.

Atmospheric Pressure.—The readings of the barometer were above their averages till February 7th, being as much as 0·53 in. above on January 19th, the mean daily excess for the 38 days being 0·13 in.; from February 8th to March 2nd it was below, being particularly so on the 21st, 22nd, and 26th of February, when it was as much as 1·29 in., 0·98 in., and 0·99 in. respectively below, and on several other days it was as much as three-quarters of an inch below its average, the mean daily deficiency for the 23 days ending March 2nd being 0·44 in.; from March 3rd to the 11th it was above, the mean daily excess being 0·14 in.; from March 12th to the 17th it was below, the mean daily deficiency being 0·26 in.; from March 18th to May 14th it was generally above, the mean daily excess being 0·23 in.; from May 15th to the 24th it was below, the mean daily deficiency being 0·16 in.; from May 25th to June 18th it was above its average, the mean daily excess being 0·16 in.; from June 19th to August 5th it was generally below, being as much as 0·70 in. below on June 23rd, the mean daily deficiency for the 48 days ending August 5th being 0·14 in.; from August 6th to the 17th it was above, the mean daily excess being 0·13 in.; from August 18th to the 23rd it was below, the mean daily deficiency being 0·18 in.; from August 24th to September 5th it was above, the mean daily excess being 0·09 in.; from September 6th to the 10th it was below, the mean daily deficiency being 0·27 in.; from September 11th to the 15th it was above, the mean daily excess being 0·11 in.; from September 16th to October 9th it was generally below, the mean daily deficiency for the 24 days being 0·31 in.; from October 10th to November 13th it was generally above, the mean daily excess being 0·17 in.; from November 14th to the 19th it was below, being particularly so on the 17th and 18th when it was as much as 0·79 in. and 0·70 in. respectively below, the mean daily deficiency for the 6 days being 0·36 in.; from November 20th to December 6th it was above, the mean daily excess being 0·24 in.; from December 7th to the 14th it was below, being particularly so on the 13th, when it was as much as 0·80 in. below, and on several other days it was as much as half an inch below its average, the mean daily deficiency for the 8 days being 0·45 in.; from December 15th to the 18th it was above, the mean daily excess being 0·34 in.; from December 19th to the 22nd it was below, being as much as 1·15 in. below its average on the 20th, the mean daily deficiency being 0·52 in.; and from December 23rd to the 31st it was above its average, being more than half an inch in excess on two or three days, the mean daily excess for the 9 days ending December 31st being 0·38 in.

The highest reading of the barometer at the height of 159 feet above the sea was 30·536 ins. on December 29th; and the lowest was 28·561 ins. on February 21st. The yearly range was 1·975 in.

Temperature.—The temperature of the air was below its average till January 18th, being particularly so on the 2nd, 3rd, 4th, and 5th, the mean daily deficiency for these 4 days being 14°·4; the mean daily deficiency for the 18 days ending January 18th was 6°·7; from January 19th to February 21st it was generally above its average, being particularly

* For Meteorological Tables, *see* pp. lx–lxv.

so on the 31st of January and 19th of February, when it was as much as 10°·6 and 11°·6 respectively above, the mean daily excess for the 34 days being 3°·5; from February 22nd to the 28th it was cold and below its average, the mean daily deficiency being 3°·9; from March 1st to the 16th it was above, the mean daily excess being 5°·3; from March 17th to the 21st it was below, the mean daily deficiency being 4°·3; from March 22nd to May 27th it was generally above, being particularly so on the 19th, 20th, and 21st of April and on the 13th of May, when it was as much as 10°·3, 10°·8, 11°·0, and 10°·9 respectively above, and on several other days in this period it was as much as 8° and 9° above its average, the mean daily excess for the 69 days ending May 29th being 3°·7; from May 30th to June 3rd it was below, the mean daily deficiency being 3°·9; from June 4th to the 19th it was above, being particularly so from June 15th to the 19th, the mean daily excess for the 4 days being 10°·3; the mean daily excess for the 16 days ending June 19th was 4°·5; from June 20th to the 26th it was below, the mean daily deficiency being 3°·1; from June 27th to July 11th it was above, being as much as 11°·9 in excess of the average on July 8th, the mean daily excess being 4°·2; from July 12th to August 7th it was generally below, the mean daily deficiency being 2°·1; from August 8th to the 22nd it was above its average, being particularly so from the 15th to the 18th, the mean daily excess for these 4 days being 13°·1; and the mean daily excess for the 15 days ending August 22nd was 8°·4; from August 23rd to the 29th it was below, the mean daily deficiency being 2°·8; from August 30th to September 8th it was above, the mean daily excess being 2°·5; from September 9th to the 13th it was below, the mean daily deficiency being 3°·2; from September 14th to the 20th it was above, the mean daily excess being 2°·6; from September 21st to the 26th it was below, the mean daily deficiency being 6°·0; from September 27th to October 29th it was generally above its average, being as much as 10°·6 and 10°·3 above on October 15th and 16th respectively; the mean daily excess for the 33 days ending October 29th was 2°·0; from October 30th to November 27th it was below, the mean daily deficiency being 3°·2; from November 28th to the 30th it was above, the mean daily excess being 7°·3; from December 1st to the 5th it was below, being particularly so on the 2nd and 3rd of December, when it was as much as 11°·4 and 10°·4 respectively below its average, the mean daily deficiency being 5°·7; from December 6th to the 28th it was above, the mean daily excess being 3°·2; and from December 29th to the end of the year it was below its average, being as much as 10°·3 below on the 31st, the mean daily deficiency being 5°·5.

The highest temperatures of the air were at the Royal Observatory 80°·5, and at Barnet and Cambridge 80°·1; and the lowest were at Salisbury 19°·8, at Barnet 19°·9, and at Carlisle 21°·9.

Rainfall.—The fall of rain was below its average in January, above in February, and below its average again in March; the total fall in the three months at Greenwich was 4·60 ins., or 0·35 in. below the average. The fall of rain was below its average in each of the months of April, May, and June; the total fall in the three months at Greenwich was 1·47 in., or 4·31 ins. below the average. The fall of rain was above its average in July, and below in both August and September. The total fall in the three months at Greenwich was 5·87 ins. or 1·44 in. below the average. The fall of rain was above its average in October, below in November, and above its average again in December; the total fall in the three months at Greenwich was 8·19 ins. or 1·12 in. above the average.

The heaviest falls of rain at our stations were at Stonyhurst 50·56 ins., at Bath 35·17 ins., and at Barnstaple 32·02 ins.

The least falls were at Somerleyton 17·15 ins., at Lowestoft 17·47 ins., and at Tottenham 18·57 ins.

The greatest number of days of rain were at Stonyhurst 212, at Carlisle 189, and at Guernsey 184.

The smallest number of rainy days were at Barnet 125, and at Tottenham and Oxford 135.

Thunderstorms occurred on 61 days at the different stations during the year; of these 12 were in July, 9 in June, 8 in each of the months of May, August, and October, 7 in September, 3 in both April and December, 2 in February, one in November, and none were reported in either January or March.

Thunder was heard but lightning was not seen on 59 days during the year; of these 12 were in both June and July, 9 in May, 8 in August, 6 in both September and October, 3 in December, 2 in April, and one in February.

Lightning was seen but thunder was not heard on 53 days during the year; of these 12 were in October, 9 in August, 6 in both July and September, 5 in both May and December, 4 in June, 2 in both February and April, and one in both January and March.

Solar halos were seen on 80 days during the year; of these 13 were in May, 11 in March, 10 in April, 8 in September, 7 in February, 6 in both January and August, 5 in both July and October, 4 in June, 3 in December, and 2 in November.

Lunar halos were seen on 34 days during the year; of these 11 were in March, 4 in both January and September, 3 in each of the months of February, April, and October, and 2 in each of the months of May, August, and December.

Snow fell on 60 days during the year; of these 18 were in January, 11 in each of the months of February, November, and December; 4 in March; 2 in both September and October; and one in April. The last fall in the spring was on April 17th at Halifax; none fell in May, June, July, or August; and the first fall in the autumn was on September 22nd at Halifax.

Hail fell on 73 days during the year; of these 13 were in February, 11 in November, 9 in December, 8 in both January and October, 6 in August, 4 in each of the months of March, June, and September, 3 in May, 2 in April, and one in July.

Fog prevailed on 126 days during the year; of these 20 were in January, 19 in March, 13 in both October and December, 11 in both April and November, 9 in both February and August, 8 in both June and September, and 5 in May.

PRELIMINARY TABLES.

TABLE 1.—**United Kingdom: Population** of its several **portions estimated** to the the **British Seas,** and of the **portions** of the **Army,**

* Deaths from Cerebro-spinal Fever prior to 1877 were classed with Typhus, but, since that date, have been included under this heading.
† Deaths of children under 5 years of age from Remittent Fever were classed with Enteric Fever from 1869 to 1880, but in subsequent years have been included under this heading.

TABLE 15 (*continued*).—ENGLAND.—**Deaths from Various Causes, 1869–93.**

* For the purposes of this table London includes, for recent years, the Strand Union Workhouse at Edmonton, the Holborn Union Workhouse at Mitcham, and the Metropolitan Hospitals and Asylums situated outside Registration London. Some of the figures for 1893 may differ, therefore, from those in Tables 10, 20, and 23.

NOTE.—*Up to and including* 1886 masters were excluded from the above employment and mortality figures; the latter of which contained some cases of men who died in colonial vessels and fishing vessels not registered under the Merchant Shipping Acts, whose crews are not included in the employment column.

Since 1886 masters are included in both columns, and the employment and mortality figures relate only to persons employed in vessels registered under the Merchant Shipping Acts belonging to the United Kingdom, the Isle of Man, and Channel Islands. Deaths occurring in the United Kingdom after the seamen have been discharged from their ships, and on vessels employed exclusively in rivers and inland navigation, and on yachts, are not included.

* The prices of Consols for the years 1844–52 relate to the 12 months beginning 1st April; from 1853 onwards the prices relate to calendar years. For the years 1844–88 the prices relate to stock bearing 3 per cent. interest, for 1889–93 to stock bearing 2¾ per cent.

† From the Board of Trade Statistical Abstract.

‡ The Registrar-General is unable to give precise information as to the price of meat for the years 1889–93.

§ The prices of coal are furnished by the Mineral Statistics Department of the Home Office.

‖ Derived from Returns, published by the Local Government Board, of the number of persons in receipt of Relief on the last day of each week.

Note.—An addition of territory containing a population of about 8000 was made in 1864, and the facts relating thereto are included in this Table from 1860. Previously to 1st January 1860, children who died within 24 hours after birth were counted as still-born.

* Census year.

† Cholera was epidemic in the year 1853, and war raged in the year 1864.

NOTE.—The population in the four years 1862-65 and in the years 1867-69 is estimated by means of the average annual rate of increase observed between the two enumerations of 1861 and 1866. The deaths of Frenchmen abroad, civil or military, are registered in the books of the Commune in which they were last domiciled.

* Census year. † Cholera prevailed in 1865-66, and war raged in 1870 and 1871.

1893	—	—	—	—	—	—	—	—

Note.—Statistics for the 7 years 1871-77 were not issued owing to the disturbed state of the country. The decline in registered marriages in 1870 is believed to be due to the introduction of civil registration, which occurred in that year.

* Census year.

Note.—The numbers for Rome were first included with those for the Kingdom of Italy in 1872. The population figures given for census years show the numbers enumerated on 31st December in each of those years; whereas for the end of each of the other years the population is estimated on the assumption that the rate of increase which prevailed in the last inter-censal period has since been maintained.

* Census year.

TABLE 57.—ENGLAND. **Changes** in the **Constitution** of **Registration Districts** and **Sub-districts** during the Year **1893.**

N.B.—(1.) The Name of the DISTRICT is in SMALL CAPITALS, that of the *Sub-district* in *Italics*.
(2.) The Populations quoted are the revised Numbers enumerated at the Census of 1891.

No. of District.	NAME OF REGISTRATION DISTRICT.	Date of Change.	Nature of Change.
6	MARYLEBONE - -	1893. 1 September	The sub-districts of *All Souls* and *Cavendish Square* were united under the name of *All Souls* (population 37,713).
13	HOLBORN - - -	1 June -	The sub-districts of *St. Andrew Eastern* and *Saffron Hill* were united under the name of *St. Andrew Eastern* (population 15,343).
41	BROMLEY - -	1 August -	The sub-districts of *Bromley* and *Chislehurst* were re-arranged into three sub-districts, viz.:—1. *Bromley* sub-district, consisting of the parishes of Bromley, Hayes, Keston, and Downe (aggregate population 23,815); 2. *Beckenham* sub-district, consisting of the parishes of Beckenham and West Wickham (aggregate population 21,969); and 3. *Chislehurst* sub-district, consisting of the parishes of Cudham, Knockholt, Chelsfield, Farnborough, Orpington, St. Mary Cray, St. Paul's Cray, Chislehurst, Mottingham, Foots Cray, and North Cray (aggregate population 23,469).
[illegible]	PORTSEA ISLAND -	1 June -	Part of the sub-district of *Landport*, viz.: the part of the parish of Portsea situated south of King's Road and Elm Grove including the south sides of those roads, and west of Victoria, Chester and Lennox Roads including the west sides of those roads in a straight line to the east end of Southsea Castle (population 10,657) was added to *Portsmouth Town* sub-district which was re-named *Portsmouth and Southsea* sub-district.
93 94	CHRISTCHURCH - RINGWOOD -	1 January -	Part of the parish of Christchurch (population 91) in the sub-district of *Christchurch* was transferred to the parish of Ringwood in the sub-district of *Ringwood*.
166	OUNDLE - - - -	1 July -	The sub-districts of *Oundle* and *Fotheringhay* were united under the name of *Oundle* (population 10,938).
225	NORWICH - -	1 January -	The sub-districts of *Mancroft* and *West Wymer* were united under the name of *West Wymer* (population 53,034).
266	SHERBORNE - - -	1 October -	The sub-districts of *Sherborne* and *Bradford Abbas* were united under the name of *Sherborne* (population 8,517).
[illegible]	CHARD - - -	1 September	The parish of Knowle St. Giles (population 92) was transferred from the sub-district of *Combe St. Nicholas* to that of *Ilminster*.
310	YEOVIL - - - -	1 January -	The parishes comprised within the Registration District of YEOVIL were re-arranged into four sub-districts, viz.:—1. *Coker* sub-district, consisting of the parishes of Haselbury Plucknett, North Perrott, Hardington Mandeville, Pendomer, Sutton Bingham, Closworth, Barwick, East Coker, West Coker, Odcombe, East Chinnock, West Chinnock, and Brimpton (aggregate population 5,416); 2. *South Petherton* sub-district, consisting of the parishes of Chiselborough, Norton-under-Hamdon, and South Petherton (aggregate population 3,050); 3. *Martock* sub-district, consisting of the parishes of Martock, Tintinhull, Stoke-under-Hamdon, Montacute, Thorne, and Lufton (aggregate population 5,988); and 4. *Yeovil* sub-district, consisting of the parishes of Chilthorne Domer, Ilchester, Sock Dennis, Northover, Yeovilton, Limington, Ashington, Chilton Cantelo, Pudymore Milton, West Camel, Preston Plucknett, Yeovil, and Mudford (aggregate population 13,448).

Table 87 (*continued*).—ENGLAND. Changes in the Constitution of Registration Districts and Sub-districts during the Year 1893.

No. of District.	NAME OF REGISTRATION DISTRICT.	Date of Change.	Nature of Change.
325	WESTBURY-ON-SEVERN	1893. 1 July	The parishes comprised within the two sub-districts of the Registration District of WESTBURY-ON-SEVERN were re-arranged and called 1. *Newnham* and 2. *East Dean*: the former consisting of the parishes of Blaisdon, Westbury-on-Severn, Minsterworth, Churcham, Bulley, Huntley, Longhope, Awre, Newnham, and Flaxley (aggregate population 7,245); and the latter consisting of the parishes of East Dean, Little Dean, Abinghall, and Mitcheldean (aggregate population 16,426).
329 330	STROUD TETBURY	1 October	The parish of Avening (population 894) was transferred from *Horsley* sub-district in the district of STROUD to *Tetbury* sub-district in the district of TETBURY.
364 448	LEEK CONGLETON	1 October	The parish of Biddulph (population 5290) was transferred to *Congleton* sub-district from *Norton* sub-district in the district of LEEK.
386	BIRMINGHAM	1 January	The sub-districts of *St. Thomas* and *St. Martin* were united under the name of *St. Martin* (population 72,237).
424 425	CAISTOR GLANFORD BRIGG	1 January	Part of the parish of Bigby (population 138), in the sub-district of *Caistor* was transferred to the parish of Glanford Brigg in the sub-district of *Brigg*.
447	NORTHWICH	1 February	The parishes of Shurlach, Birches, and Hulse (population 221) were transferred from the sub-district of *Northwich* to that of *Middlewich*; the parish of Wallerscoat (population 10) was transferred from the sub-district of *Weaverham* to that of *Northwich*; and the parish of Occlestone (population 96) was transferred from the sub-district of *Middlewich* to that of *Over*.
448 364	CONGLETON LEEK	1 October	The parish of Biddulph (population 5,290) was transferred from the sub-district of *Congleton* to the sub-district of *Norton* in the district of LEEK.
453	LIVERPOOL	1 September	The sub-districts of *Howard Street* and *Islington* were united under the name of *Islington* (population 34,807).
491	WHARFEDALE	1 September	The townships of Denton, Ilkley, Middleton, and Nesfield-with-Langbar (population 6,240) were separated from the sub-district of *Otley* and constituted a new sub-district called *Ilkley*.
579	KENDAL	1 April	The townships of Preston Patrick and Preston Richard from Kirkby Lonsdale sub-district and the township of Stainton from *Milnthorpe* sub-district (aggregate population 1,905) wese transferred to *Grayrigg* sub-district; and the townships of Burton in Kendal, Farleton, Holme, and Dalton (aggregate population 1,729) were transferred from *Kirkby Lonsdale* sub-district to *Milnthorpe* sub-district.
601	CARDIGAN	1 March	The parishes of Llangoedmore, Verwick, and Mount (aggregate population 1,206) were transferred from the sub-district of *Cardigan* to that of *Llandygwydd*; and the parishes of Manordivey, and Llanfihangel-Penbedw (aggregate population 1,011) were transferred from the sub-district of *Llandygwydd* to that of *Cardigan*.
611	KNIGHTON	1 January	That part of the parish of Llanfihangel Beguildy in *Llanbister* sub-district (population 549) was transferred to *Knighton* sub-district.

NOTE.—No change affecting the population of any Registration District or Sub-district was made during 1893 under the provisions of the Divided Parishes and Poor Law Amendment Acts, 1876 and 1879.

* The *Registration Counties* consist of groups of Registration Districts, which are generally co-extensive with the Poor Law Unions. A District which extends into two or more Geographical Counties is included entirely in that Registration County in which the principal town of the District, or the greater part of the population, is located. The boundaries of the Registration Counties differ therefore more or less from the boundaries of the Geographical Counties. For areas and populations of the Registration Divisions and Counties, *see* pages 64–67.

* The 633 *Registration Districts* (Paddington 1a, North Bierley 497b, and Holyhead 631 having been constituted Registration Districts since the numerical arrangement 1 to 630 was adopted on 1st January 1881) are collections of contiguous Parishes or Places combined for purposes connected with the Registration of Births, Deaths, and Marriages, and are nearly always identical with the Poor Law Unions of the same names; they are arranged, according to the local position, under the Registration Counties. The Registration Sub-districts (2107 in number at the end of the year 1893) are sub-divisions of Registration Districts, within which the Births and Deaths are registered by Registrars severally appointed for that purpose. The letter *W* denotes that the Sub-district contains within its limits a Workhouse Establishment belonging to the District or Union; *w* indicates a Workhouse Establishment receiving inmates from other Districts than the one in which it stands; *H* indicates a Hospital or Infirmary; *L* a Lunatic Asylum; and repetitions of these letters show the number of such Institutions in each Registration sub-district.

† The Deaths in the principal Institutions in England in 1893 are given on pages 71-94.

‡ 6 : 1.—On 1st September 1893 the sub-districts of *Cavendish Square* and *All Souls* were united for registration purposes and called *All Souls.*

* 88 : 3, 4.—On 1st June 1893 part of the sub-district of *Landport* was added to *Portsmouth Town*, which was re-named *Portsmouth and Southsea* sub-district. As the births and deaths in the revised areas from the beginning of the year could not be ascertained, the figures for the two sub districts taken together are shown in the Table.

† 93 : 1 and 94 : 1.—On 1st January 1893 part of the parish of Christchurch was transferred from the sub-district of *Christchurch* to that of *Ringwood*.

* 448 : 2.—On 1st October 1893 the parish of Biddulph was transferred from the sub-district of *Congleton* to the sub district of *Norton* in the district of LEEK (364 : 1). The Births and Deaths are shown as if the change had taken place at the beginning of the year.

† 450.—The District of CHESTER comprises the three Poor Law Unions of Tarvin (Tattenhall sub-district), Chester (Chester Castle and Chester Cathedral sub-districts), and Hawarden (Hawarden sub-district).

‡ 453 : 6.—On 1st September, 1893, the sub districts of *Howard Street* and *Islington* were united for registration purposes and called *Islington*.

DEATHS IN WORKHOUSES, HOSPITALS, AND PUBLIC LUNATIC ASYLUMS.

1893.

The following Table shows the numbers of deaths (Persons, Males, and Females) registered during 1893 in the Workhouses, Hospitals, and Public Lunatic Asylums of England. These figures afford the means of correcting the mortality of districts and sub-districts in which these Institutions are situated. The Table includes 1950 Institutions; of which 754 are Workhouses, Workhouse Infirmaries, or Workhouse Schools; 1102 Hospitals or Infirmaries; and 94 Lunatic Asylums. The Lunatic Asylums are mostly County and Borough Asylums, but a few private Asylums which receive pauper patients (held on that account to be public for the purposes of this Table) are also included. In these 1950 Institutions 70,463 deaths were registered during the year, or 12·4 per cent. of the total deaths in England and Wales, against 11·7 and 11·9 per cent. in the preceding two years; 40,577 occurred in Workhouses, 23,457 in Hospitals, and 6429 in Lunatic Asylums. The proportion to total deaths was 7·12 per cent. in Workhouses, 4·12 in Hospitals, and 1·13 in Lunatic Asylums. The proportion of deaths recorded in Workhouses, which had been 7·17 and 7·10 per cent. in 1891 and 1892, was 7·12 per cent. in 1893.

Information relating to the deaths recorded in many Private Lunatic Asylums, Private Asylums for Idiots and Imbeciles, and in a few other institutions, will be found in the notes to the following pages.

Deaths in Workhouses, Hospitals, and Public Lunatic Asylums, 1893.

* When a person dies from an operation performed on account of any disease or injury the nature of which is stated in the certificate, the death is classed under that disease or injury.

OF the above 5041 ACCIDENTS, 67 are stated to have occurred to Women in a state of INTOXICATION. In 147 other cases Death was accelerated by the supervention of DELIRIUM TREMENS, ERYSIPELAS, MORTIFICATION, PYÆMIA, or TETANUS.* Here follow the details:—

Causes inducing or accelerating Deaths from Accident.	All Ages.	Total under 1 Year: Infants under 1 Month.	Total under 1 Year: Others.	1–	2–	3–	4–	Total under 5 Years.	5–	10–	15–	20–	25–	35–	45–	55–	65–	75–	85 and upwards.
Intoxication at time of Accident	67	–	–	–	–	–	–	–	–	–	1	–	6	24	17	13	6	–	–
Acceleration by Delirium Tremens	3	–	–	–	–	–	–	–	–	–	–	–	1	1	1	–	–	–	–
Acceleration by Erysipelas	24	–	2	–	–	–	–	2	1	–	1	–	2	5	2	6	3	2	–
Acceleration by Mortification	9	–	–	–	–	–	–	–	–	–	–	–	–	–	–	4	5	–	–
Acceleration by Pyæmia	91	3	5	–	3	1	1	13	4	6	3	3	6	11	13	17	10	5	–
Acceleration by Tetanus*	20	1	–	–	–	1	–	2	8	1	1	–	3	2	2	1	–	–	–

* Cases of Tetanus which are not stated to be the result of injury are classed as "Idiopathic Tetanus" in the Table of Causes of Death see page 115).

INDEX OF REGISTRATION DISTRICTS.

The following Index furnishes a reference to the *Number* of each REGISTRATION DISTRICT in the topographical arrangement adopted in the Tables of Abstracts contained in the Report.* The alphabetical arrangement places compound names in the order in which they are pronounced: thus, East Ashford will be found under the letter E, and *not* under A.

In consequence of numerous alterations (amalgamations of districts and formations of new districts) since the numerical arrangement, 1 to 623, was adopted in the Abstracts for the year 1847, the districts were re-numbered consecutively from 1 to 630 in the Abstracts for the year 1881. Since that date three new Registration Districts have been formed, the District of Kensington (1) having been divided into Paddington (1*a*) and Kensington (1*b*), the District of Bradford (497) into Bradford (497*a*) and North Bierley (497*b*), and the District of Anglesey (630) into Anglesey (630) and Holyhead (631).

For names of Towns, such as Bournemouth, Maidenhead, &c., which are not found in this "Index of Registration Districts," see the "Index of Registration Sub-districts" (pp. 208–217) *and "Index of certain Towns"* (pp. 220, 221).

INDEX OF REGISTRATION SUB-DISTRICTS.

[This alphabetical arrangement places the Registration Sub-Districts (or Registrars' Districts) having *compound names* in the order indicated by the usual pronunciation of those names; thus, East Grinstead will be found under the letter E, and not under G; St. James under the letter S, and not as "James, St." The number against each Sub-District, in the third column, refers to its numerical place in the Tables of Abstracts; thus, Abbey Holme (573 2) is the 2d Sub-District of the Wigton District, No. 573.]

Sub-District.	District.	No.
A		
Abbey Holme	Wigton	573; 2
Abbots Bromley	Uttoxeter	366; 2
Abbotsbury	Weymouth	264; 4

SUPPLEMENT

TO THE

TWENTY-SEVENTH REPORT OF THE REGISTRAR-GENERAL

OF

MARRIAGES, BIRTHS, AND DEATHS IN IRELAND,

CONTAINING

DECENNIAL SUMMARIES

FOR THE YEARS 1881–1890.

TO

HIS EXCELLENCY, ROBERT OFFLEY ASHBURTON, BARON HOUGHTON,

&c., &c., &c.,

LORD LIEUTENANT-GENERAL AND GENERAL GOVERNOR OF IRELAND.

MAY IT PLEASE YOUR EXCELLENCY:

I have the honour to submit to Your Excellency a Report and Summary Tables relating to the Marriages, Births, and Deaths registered in Ireland during the ten years ended on the 31st December, 1890.

This is the second occasion on which a Report of this character has been prepared, the first decennial summary of the results of the Registration of Marriages, Births, and Deaths in Ireland having been submitted to Your Excellency's predecessor, Earl Spencer, in the year 1884. In that Report it was explained that the year 1880 completed the first decade ending sufficiently near a Census period to make comparisons between the number and nature of the population, and the statistics of Marriages, Births, and Deaths comprised in the Report with sufficient accuracy to obtain a correct indication of the movement of the population. A period has now been reached at which the second of two decades synchronous with two intercensal periods has been completed. Many improvements in registration have taken place in the interval, and twenty-seven years of registration of Marriages, Births, and Deaths have been completed in Ireland.

The systematic registration of Births and Deaths was instituted in Ireland in 1864; therefore, at the time of taking the Census of 1871, there was not a complete decade of registration records to deal with; so that, as already stated, in 1881 the first opportunity presented itself of making a summary of the kind here submitted.

The registration of Marriages, other than those celebrated by the Roman Catholic clergy, was provided for under the Act 7 & 8 Vic., cap. 81, which came into force on the 1st April, 1845, but Roman Catholic Marriages were not registered until the year 1864, when the Act 26 & 27 Vic., cap. 90, for the registration of those Marriages came into operation.

The following Acts amending the law relating to the registration of Births, Deaths, and Marriages, came into operation during the period from the 1st January, 1881, to 31st December, 1890.

Marriages—49 & 50 VIC., CAP. 27 (1886)—Guardianship of Infants Act.—This enactment altered the requirements as to consent in cases of Marriages of minors.

Births and Deaths—43 & 44 VIC., CAP. 13 (1880). —This statute amended the 26 Vic., cap. 11, and introduced alterations in the law of which the following are the principal :—

1. Change in the limit of time for registering Births and Deaths. 2. Change in the Legal Qualifications of Informants. 3. Provision for registering Births, within three months, when the Informant has left the District in which the Birth took place. 4. Change in the limit of time for adding Baptismal or other name; and provision for altering name. 5. Certificate of Registry of Birth to be given on payment of a fee of 3*d*. 6. Limit of time fixed within which the Certificate of "Finding of Jury" must be sent by the Coroner. 7. Certificate of Registry or Notification of Death to be given without fee to parties named in the 17th section. 8. Certificate of Cause of Death to be procured, and produced to the Registrar by the Informant, and not forwarded direct to the Registrar by the Medical Practitioner as heretofore. 9. Every "Deputy Superintendent Registrar" and "Deputy Registrar" to be, and be, styled "Assistant Superintendent Registrar" and "Assistant Registrar" respectively; and to act, when required so to do, by the Superintendent Registrar and Registrar. 10. Change as to Correction of Errors in Entries of Births and Deaths. These are divided into Clerical Errors and Errors of Fact or Substance—the latter to be corrected by the Registrar on "Statutory Declaration" before a Justice of the Peace, while the former (Clerical Errors) are divided into two classes, particulars as to which will be found in the Regulations. 11. Change as to Fees.

The Burial Clauses of this Statute also make provision for the transmission to the Registrar of Notice of Burial, in case neither an Order of the Coroner nor a Certificate from the Registrar was presented at the interment. Certain requirements are also laid down with respect to the burial of Still-born children, and of more than one body in the same coffin.

The following Acts of Parliament, which came into operation during the decade, have also more or less affected this Department :—

Veterinary Surgeons Act, 44 & 45 VIC., CAP. 62 (1881).

Savings Banks Act, 50 & 51 VIC., CAP. 40 (1887).

Friendly Societies Amendment Act, 50 & 51 VIC., CAP. 56 (1887).

[TABLE I.

GENERAL SUMMARY.

Table I. gives a general summary of the numbers of Marriages, Births, and Deaths registered in Ireland from the commencement of the Registration Acts in 1864, to the close of the year 1890, and of the amount of emigration during the same period, with the yearly averages for the two decennial periods 1871–80 and 1881–90.

TABLE I.—Showing for each of the years 1864–90, the estimated POPULATION; the number of MARRIAGES, BIRTHS, and DEATHS registered, and the number of EMIGRANTS enumerated, with the rates per 1,000 of the Population represented thereby, and the averages for the ten years 1871–80 and the ten years 1881–90.

YEARS.	*Estimated Population in the middle of each year.	Numbers *Registered.*			Number of Emigrants as returned by the Enumerators.	Rate per 1,000 of Estimated Population.			
		Marriages.	Births.	Deaths.		Marriages.	Births.	Deaths.	Emigrants.

* See Page 49. † Mean of Census Populations 1871–81 and 1881–91.

An examination of Table I. shows that the estimated population of Ireland had diminished between the years 1880 and 1890 to the extent of 484,689, or at the rate of 9·32 per cent. during the decade 1881–90: this decrease was uninterrupted from year to year, and there was not, as in the preceding decade, any year, such as 1877, when an increase was estimated.

The distribution of Marriages registered in Ireland is shown by Provinces and Counties in Table II., where the actual number registered in each area, and their rate per 1,000 of the population, is given. The average Marriage rates for the provinces were, Leinster 4·9, Munster 3·8, Ulster 4·8, Connaught 3·1, compared with 5·3, 4·5, 4·9, and 3·9, for the registration provinces—which are not exactly identical with the geographical provinces—respectively, for the previous decade; showing a decrease in rate for each province. Comparing the rates for the geographical counties in the last decade with

those for the registration counties in the previous decade, the counties of Meath and Antrim are the only ones which show an increase, the former of from 3·5 to 3·6, and the latter from 6·2 to 6·6 per 1,000.

The five counties in which the Marriage rate was highest were, Dublin 6·9, Antrim 6·6, Down 4·9, Armagh 4·7, and Londonderry 4·7; and those in which it was lowest were, Galway 2·8, Clare 3·1, Cavan 3·1, Sligo 3·1, and Roscommon 3·2.

TABLE II.—MARRIAGES, BIRTHS, and DEATHS registered in each PROVINCE and COUNTY during the Ten Years, 1881–90, with the AVERAGE ANNUAL RATES per 1,000 of the MEAN POPULATION represented thereby; also the number of Births to one Marriage, and the proportion of the total Births which were Illegitimate.

The total number of Marriages registered during the ten years 1881–90 was 213,095 as compared with 250,162 during the previous decade, showing a decrease of 37,067, or 14·8 per cent. The average marriage rates per 1,000 of the population were, for the two decades, 4·73 for the earlier and 4·31 for the later. The largest number of Marriages which took place in any one year was 22,585, or at the rate of 4·54 per 1,000 in the year 1884; the smallest was for the year 1888, when the number was 20,060, or at the rate of 4·18 per 1,000 of the population.

The total number of Births registered during the decade was 1,150,463, as compared with 1,402,277 for the previous ten years, being 251,814, or 18·0 per cent. less. The average birth-rate for the earlier period was 26·5, and for the later 23·3 per 1,000 living. The greatest number of births in any one year during the ten years 1881–90 took place in the year 1881, when there were 125,847, and the smallest number in 1890, namely, 105,254, or at the respective rates of 24·5 and 22·3 per 1,000 of the population.

The Deaths for the period under consideration numbered 883,156 as compared with 966,745 for the previous ten years, thus showing a decrease of 83,589 or 8·6 per cent., and a decrease of death-rate from 18·3 in the earlier to 17·9 per 1,000 living in the later period. This decreased death-rate is no doubt owing to an advance in sanitary measures by which the public health has been materially improved.

As the Births numbered 1,150,463 and the Deaths 883,156, the former exceeded the latter by 267,307, indicating a natural increase in the population of Ireland to this amount; while the estimated diminution has been 484,689, the natural increase having been more than counterbalanced by emigration.

The greatest number of Deaths during the decade occurred in the year 1883, when there were 96,228, and the smallest in 1889, when there were 82,908 only, the respective rates being 19·2 and 17·4 per 1,000 living.

During the decade 770,706 emigrants left Ireland as compared with 623,933 for the period 1871–80—the rates respectively being 15·6 and 11·8 per 1,000 of the mean population of the respective periods. A decrease therefore of 503,399 in the population would appear to have taken place during the decade, the real decrease up to the Census date (5th April, 1891), according to the Census Returns of 1891, being 470,086, showing a discrepancy of 33,313, or only 0·6 per cent. of the population.

I have already dealt with this question in detail in my report for the second quarter of 1881, and my detailed annual report for the same year.*

In selecting the areas for which the abstract tables were to be compiled, it was not considered necessary to compile statistics for areas smaller than Superintendent Registrars' districts which coincide with the districts of the Registrars of Marriages under 7 & 8 Vic., cap. 81, and with the Poor Law Unions. Of these there are 160, having in 1891 an average population of 29,405. The Registrars' districts, of which there are 799, with an average population of 5,888 in 1891, appear to be too small in area and population to warrant separate abstracts being made for each.

I shall now proceed to submit, for Your Excellency's consideration, remarks upon some of the more important features connected with the returns of Marriages, Births, and Deaths during the decade 1881–90. In discussing these statistics, I shall avoid detail as much as possible, and only touch upon those matters which may serve to indicate important social movements, or which may afford useful information to those whose duty it is to take measures for the preservation of the public health. Although many interesting professional points would naturally arise in considering the tables of causes of death, yet I do not consider it advisable to deal particularly with those, and I shall only treat of details where they bear upon great questions of public health or sanitation.

MARRIAGES.

The number of Marriages registered during the decade was 213,095, or at the average annual rate of 4·31 per 1,000 of the mean population. The greatest annual number registered was 22,585, or at the rate of 4·54 per 1,000 of the population, in the year 1884, and the smallest number was in 1888, when but 20,060 were recorded, being at the rate of 4·18 per 1,000 of the population.

* "Quarterly Return of Marriages, Births, and Deaths in Ireland," No. 70, pages 60 and 61; and "Eighteenth Detailed Annual Report of the Registrar-General of Marriages, Births, and Deaths in Ireland," pages 4 and 5.

Of the marriages registered during the decade, 146,159 were according to the rites and ceremonies of the Roman Catholic Church; 36,008 were celebrated according to the rites and ceremonies of the Church of Ireland ; 22,441 were in Registered Presbyterian Meeting-houses; 3,715 in "Registered Buildings" belonging to various religious denominations; 4,645 by Civil Contract in District Registrars' Offices; 82 according to the usages of the Society of Friends; and 45 according to the Jewish rite. The relative average annual rates of these marriages, as deduced from the foregoing statement, to every 1,000 of the mean population of each of the principal religious denominations were, approximately, Roman Catholics, 3·90; Protestant Episcopalians, 5·81; Presbyterians, 4·90.

Comparing the foregoing statement with the corresponding figures for the previous decade, it appears that the number of marriages registered decreased by 37,067, or 14·1 per cent., and the marriage-rate per 1,000 of the population from 4·73 to 4·31.

The Roman Catholic marriages registered decreased from 176,248 to 146,159 to the extent of 30,089, or 17·1 per cent., the rate having declined from 4·35 to 3·90 per 1,000 persons. Those according to the rites of the Church of Ireland fell from 39,991 to 36,008, or to the extent of 3,983, or 9·96 per cent., the rate having changed from 6·12 to 5·81. Those in Presbyterian Meeting-houses (according to the Presbyterian form) fell from 25,011 to 22,441, being a decline of 2,570, or 10·28 per cent., the rate having altered from 5·17 to 4·90.

The marriages in Registered Buildings belonging to various religious denominations (under the Act 7 & 8 Vic., cap. 81) rose from 3,265 to 3,715, being an increase of 450, or 13·8 per cent. This increase is mainly due to marriages between members of the Methodist community, a body which increased in number between the Census periods of 1881 and 1891, while the numbers of all the other larger religious denominations materially decreased. Marriages by Civil Contract have decreased from 5,507 to 4,645, or to the extent of 862, or 15·65 per cent. The marriages among members of the Society of Friends fell from 117 to 82, being a decline of 35, or 29·91 per cent. Among the Jews marriages increased from 23 to 45, or nearly double, which accords with what might have been anticipated from the large proportional increase of the number of the Jewish community in Ireland shown by the Census of 1891.

TABLE III.—MARRIAGES registered in IRELAND in each of the ten years, 1881-90, according to the MODES OF CELEBRATION; with the RATES per 1,000 of the POPULATION represented.

As in many parts of the country about one-half of the annual Roman Catholic Marriages take place between Christmas and Shrovetide, the number of marriages recorded in the first quarter of the year is much greater than that in any other, as shown in the following Table.

TABLE IV.—MARRIAGES registered during each QUARTER of the TEN YEARS, 1881–90.

YEAR.	NUMBER OF MARRIAGES REGISTERED DURING THE QUARTER ENDING THE LAST DAY OF											
	March.			June.			September.			December.		
	Roman Catholic Marriages.	Others.	Total.	Roman Catholic Marriages.	Others.	Total.	Roman Catholic Marriages.	Others.	Total.	Roman Catholic Marriages.	Others.	Total.
1881 . . .	6,123	1,520	7,643	3,021	1,569	4,590	2,936	1,798	4,734	2,901	1,958	4,859
1882, . . .	6,138	1,576	7,714	3,184	1,724	4,908	2,926	1,782	4,708	2,933	1,766	4,699
1883, . . .	5,123	1,629	6,752	3,392	1,561	4,953	2,967	1,727	4,694	3,134	1,835	4,969
1884, . . .	6,567	1,558	8,125	3,241	1,625	4,866	3,012	1,678	4,690	3,053	1,851	4,904
1885, . . .	5,668	1,525	7,193	3,253	1,609	4,862	2,779	1,658	4,437	2,891	1,794	4,685
1886, . . .	5,767	1,411	7,178	2,544	1,487	4,031	2,963	1,586	4,549	2,974	1,862	4,836
1887, . . .	5,642	1,484	7,126	3,003	1,714	4,717	2,846	1,687	4,533	2,733	1,836	4,569
1888, . . .	4,805	1,539	6,344	2,997	1,673	4,670	2,827	1,674	4,501	2,732	1,813	4,545
1889, . . .	5,892	1,523	7,415	2,760	1,649	4,409	2,945	1,749	4,694	3,190	1,813	5,003
1890, . . .	5,010	1,391	6,401	3,317	1,677	4,994	2,976	1,848	4,824	2,994	1,777	4,771
Ten Years, 1881-90, .	56,735	15,156	71,891	30,712	16,288	47,000	29,177	17,187	46,364	29,535	18,305	47,840
Average Proportion per cent. of the yearly number of each class of Marriages registered in each Quarter,	38·8	22·6	33·7	21·0	24·3	22·1	20·0	25·7	21·8	20·2	27·4	22·4

From this it appears that the average proportion per cent. of all the marriages in Ireland which took place in the first quarter of the year was 33·7, while in the other quarters the proportions were respectively 22·1, 21·8, and 22·4, in other words the proportion was nearly constant during each of the last three quarters of the year. The table shows that the average proportion of Roman Catholic marriages during the first quarter of the year was 38·8 per cent. of the total marriages according to the rites of that Church, and that during the other three quarters the proportions varied from 20·0 to 21·0 per cent. only. The marriages of persons of other denominations were slightly more numerous in the last than in any other quarter.

Table V. shows for the decade the number and proportion per cent. of persons who wrote their names in the Registers, of minors, of widowers, and widows who were married.

[TABLE V.

TABLE V.—Showing as regards MARRIAGES in Ireland and in each of the Four Provinces during the years 1881–90, the Proportion per cent. of Persons who SIGNED THEIR NAMES, of Persons NOT OF FULL AGE, and of RE-MARRIAGES. The figures for the years 1881–84 refer to Registration Provinces; those for 1885–90 to the Provinces Proper.

EDUCATION OF PERSONS MARRIED.

The proportion of persons who "signed their names in writing" as compared with those who signed "by mark" in the marriage registers and certificates affords an interesting indication of the degree of elementary education of persons married, and when these indications are compared from period to period they afford a useful test of the progress of education. Thus—

In 1864, 61·4 per cent. of the men and 49·7 per cent. of the women signed in writing; in 1871 the proportions were—men 62·5 per cent., women 54·8 per cent.; in 1880, men 73·8 per cent., women 69·1; in 1890, men 79·6, women 79·1. It is interesting to note that while there has been a steady increase in both sexes in the proportion signing by writing, the proportion among women, which was much below that for men in 1864, became almost equal to the rate for men in 1890. Table V shows that this test of education for 1890 would arrange the Provinces in the following order of merit—Leinster, Munster, Ulster, Connaught, for both sexes. It is curious to note that while in Leinster, Munster, and Connaught the married women seem to be better educated than the men, in Ulster the reverse is the case. This, however, is not the place to go into further details in connexion with the question of education which is fully dealt with in the Report of the Census Commissioners for 1891.

Early Marriages.

During the last thirty years there has been a well marked decrease in early marriages in Ireland. In the year 1864 of the males married 3·77 per cent. were under full age, in 1880 the proportion was 2·64 per cent., and in 1890 it was but 2·02 per cent.; and at no time during the interval between 1880 and 1890 was the percentage of 2·64 reached. Among females the decrease of early marriages is more marked; in 1864 the proportion of minors was 18·16 per cent. of all the women married; in 1880 it was only 11·79 per cent. or less than two-thirds of the proportion in the former year; and in 1890 it fell to 8·75 per cent., or less than one-half of the percentage for 1864. The highest proportion of minors married in 1890 was in Ulster, and the lowest in Munster. In the former province the husbands who were not of age formed 2·71 per cent. of the males married, and the wives under age constituted 9·83 per cent. of the total; and in Munster the corresponding percentages were 1·27 for the males and 7·22 for the females married. As may be observed from Table V. the diminution of early marriages since 1881 is more marked in the West than in any other portion of Ireland. In 1864 the proportions of males and females not of full age who were married in the Western Registration Division (which nearly coincides with the province of Connaught) were respectively 2·81 per cent. and 24·09 per cent.; in 1880 they were 3·74 per cent. and 17·87 per cent., showing a slight increase of the number of very young men married, but a material decrease of very young women married. During the decade 1881-90 the proportion of marriages of minors in Connaught decreased among males from 2·51 per cent. in 1881 to 1·50 per cent. in 1890, and among females from 13·03 per cent. to 9·42 for the same period. It would thus appear that since 1864 through Ireland generally, and especially in the West, very early marriages have become less frequent. This decrease of early marriages among women accounts to a great extent for the diminution in the average size of families in Ireland, and also explains in part the diminished birth-rate. Further information on this important point will be found in the General Reports of the Census Commissioners for 1881 and 1891 *

BIRTHS.

The number of Births registered in Ireland during the decade was 1,150,463, being an annual average of 115,046, or at the rate of 23·3 per 1,000 of the mean population. The largest number of births occurred in the year 1881, viz., 125,847, or at the rate of 24·5 of the population, and the smallest number in 1890, when there were 105,254 registered, or at the rate of only 22·3 per 1,000 of the population.

As regards the distribution of the Births in Ireland, the following statement shows the four provinces arranged according to the average annual rate per 1,000 of the mean population represented by the births registered during the ten years, 1881-90 :—

Provinces.	Birth-rate per 1,000.	Provinces.	Birth-rate per 1,000
Leinster,	23·7	Munster,	23·0
Ulster,	23·6	Connaught,	22·4

* See "Census of Ireland, 1881; Part II.; General Report," pp. 17–19; and "Census of Ireland, 1891; Part II.; General Report," pp. 20–22.

ILLEGITIMACY

Of the 1,150,463 births registered in Ireland during the decade, 31,162 or 2·7 per cent. were illegitimate. In the preceding decennium the corresponding percentage was 2·4. In the following Table the proportion of illegitimate births is set out by Provinces.

TABLE VI.—Per-centage of Illegitimate to Total Births in Ireland and each of the Provinces during the Ten Years, 1881–90.

DIVISIONS.	PER-CENTAGE OF REGISTERED BIRTHS WHICH WERE ILLEGITIMATE.										
	Year.										Ten Years, 1881–90.
	1881.	1882.	1883.	1884.	1885.	1886.	1887.	1888.	1889.	1890.	
IRELAND, . . .	2·5	2·7	2·6	2·7	2·8	2·7	2·8	2·9	2·8	2·7	2·7
LEINSTER, . .	2·2	2·2	2·1	2·4	2·3	2·2	2·3	2·5	2·5	2·5	2·3
MUNSTER, ...	1·8	2·0	2·1	2·2	2·2	2·1	2·2	2·2	2·2	2·2	2·1
ULSTER, ...	4·1	4·3	4·1	4·1	4·3	4·2	4·6	4·4	4·4	4·0	4·3
CONNAUGHT, . .	0·8	0·9	0·7	0·8	0·9	0·8	0·6	0·7	0·7	0·8	0·8

From the foregoing (Table VI.) it will be observed that the proportion of illegitimate births to the total births registered was greatest in the province of Ulster, where it reached 4·3 per cent., and least in the province of Connaught, where the percentage was only 0·8. In Table VIII. it will also be noticed that illegitimate births were proportionally more numerous in some of the districts comprising manufacturing towns. It is also observed that in the rural districts of Ulster, in which are situated many small towns and "mill villages," the proportion of illegitimate births is slightly (0·1 per cent. of all births in those localities) higher than in the civic districts taken collectively. A similar state of things is also found regarding the province of Leinster, but the reverse is found in the other two provinces, where the rural population bears a greater proportion to the town population than in either Leinster or Ulster. Further attention will be called to this subject when discussing the relation between the number of marriages and the number of births registered.

The number and relative proportion of births in each quarter are shown in Table VII., from which it appears that the birth-rate is higher in the first two than in the last two quarters of the year, the births, as might be anticipated, corresponding closely with the larger number of marriages which take place in the first quarter of the year as already pointed out (page 10).

TABLE VII.—The Number of BIRTHS registered in Ireland during each QUARTER of the Ten Years, 1881–90, with the Average Quarterly Numbers for that period, and the Annual Rates per 1,000 of the Mean Population represented thereby.

* Unions or Superintendent Registrars' Districts containing Towns which in 1881 or in 1891 had a population of 10,000 or upwards.
† All Unions other than those specified in Note (*)

Table VIII. is constructed mainly with the view of showing the relations between the number of marriages registered and the number of births registered in Ireland, and in the more important groups of districts, distinguishing town districts from country districts.

Taking the whole of Ireland it will be observed that the annual average rate throughout the decade 1881–90 per 1,000 of the mean population was—for marriages 4·3 and for births 23·3, and that the average number of births to each marriage was 5·4. For the previous decade 1871–80 the respective numbers were 4·7, 26·5, and 5·6, showing a decrease under each head in the last as compared with the former decade.

These figures cannot be taken as an exact measure of the fecundity of marriages in Ireland, but nevertheless they show a tendency to decrease in the average number of children to each marriage; and, taking the twenty years for which we have now complete records, and even making some allowance for illegitimate births, it may be fairly assumed that the average fecundity of Irish marriages is about 5·5 children per marriage. It is, however, always to be noted that many young married people emigrate shortly after marriage, and that therefore, although their marriages appear in the Irish registers, the births of their children do not. The figures in Table VIII. afford a ready method of comparing the fecundity of marriages in town with those in the country, which give respectively 4·4 and 6·1 children per marriage. It is to be noted that the aggregate population of towns of 10,000 inhabitants and upwards in Ireland increased from 824,935 to 844,549 between the Census periods of 1881 and 1891, while the rural population diminished: thus we have a partial explanation of the general diminution in the fecundity of Irish marriages when the past two decades are compared with one another, inasmuch as the less prolific portion of the population have increased and the more prolific diminished. The fact that a considerable number of people go into the larger towns to get married is a disturbing element which cannot be estimated, but which nevertheless should not be overlooked when comparing town and country marriage rates and their relative fecundity. It will be observed that the greater tendency to fecundity of marriages in country than in town districts prevails in each of the four provinces the respective rates—being 4·3 and 5·5 for Leinster, 4·4 and 6·7 for Munster, 4·4 and 5·4 for Ulster, and 5·8 and 7·4 for Connaught.

The four provinces are related to one another in regard to fecundity of marriages, as follows—Leinster, 4·8; Munster, 6·0; Ulster, 5·0; and Connaught, 7·2, as compared with 5·4 for the whole of Ireland. Thus the provinces of Leinster and Ulster, with their large town population, are under the average of Ireland, while Munster and Connaught, with their large rural population, are over the average. It will be observed that the group with the highest rate is that comprising the rural districts of Connaught where the ratio is 7·4, and the lowest is the civic group of Leinster where it is but 4·3.

If the relation between the number of births to marriages, and the death-rate of the population be compared, it will be found that where the death-rates are highest the proportion of births to marriages is lowest, and *vice versâ*. A comparison between columns 6 and 10 of Table VIII. shows that this rule is almost invariable, and that it is most strongly marked in the contrast between town and country groups of districts, thus pointing to the conclusion that the lower state of vitality of town populations tends to diminish the birth-rate, although the marriage-rate is high.

It must not be inferred from the increase of illegitimate in proportion to legitimate births that an increase of immorality has occurred. The legitimate births have fallen from 1,368,238 for the decade 1871–80 to 1,119,301 for the decade 1881–90, being a decrease of 248,937, or 18·2 per cent., while during the same period the number of marriages fell from 250,162 to 213,095, being a decrease of 37,067, or 14·8 per cent.—the decreased fecundity accounting for the difference in ratio between the decrease of marriages and the decrease of births. The illegitimate births fell from 34,039 for the former to 31,162 in the latter decade, being a decrease of 2,877, or 8·5 per cent., which is somewhat greater than the percentage of decline in the mean population of the respective decades, thus tending to show that immorality had decreased.

DEATHS

The deaths registered in Ireland during the decade 1881–90 amounted to 883,156. The mean population estimated for the same period was 4,939,793, which would on calculation afford an average annual death-rate of 17·88 per 1,000 of the population for the whole of Ireland; but, as will be seen further on, the variations in death-rate were very great in different parts of the country. The death-rate also varied considerably during different years of the decade; thus in 1883 it was 19·2, but in 1882 only 17·3 per 1,000.

TABLE IX.—The number of DEATHS registered in Ireland during each QUARTER of the Ten Years 1881-90, with the Average Quarterly Numbers for that period, and the Annual Rates per 1,000 of the Mean Population represented thereby.

QUARTER ENDING.	YEARS, AND NUMBER OF DEATHS REGISTERED.											Equivalent Average Annual Rate per 1,000 of Mean Population.	Average percentage of Annual Number of Deaths registered in each Quarter.

Year,	90,035	88,500	96,228	87,154	90,712	87,292	88,585	85,892	82,908	85,850	88,316	17·9	100·0

The above Table shows the number of deaths registered in each quarter during the decade, with the average rates for the ten years, and the average percentage of deaths registered during each of the four quarters. The average percentage of the annual number of deaths registered in the first quarter was 30·2, and the rate 21·7 per 1,000 of the mean population; for the second, 26·6 per cent., with a rate of 19·1 per 1,000; for the third, 20·4 per cent., with a rate of 14·7 per 1,000; and in the fourth quarter, 22·8 per cent., with a rate of 16·4 per 1,000, the highest rate being in the first quarter, when the cold weather and the continued privations of the winter months have the greatest effect on the health of the people, as will be pointed out further on when discussing the causes of death.

DISTRIBUTION OF DEATHS IN IRELAND.

On the passing of the Act for the Registration of Births and Deaths in Ireland, the country was divided into eight registration divisions, and until the year 1881 the statistics of deaths were arranged according to these divisions. For reasons explained in the Annual Report for 1881,* these artificial divisions have been abandoned as cumbersome and inconvenient, but the Tables were compiled according to "Registration" Provinces, Counties, and Superintendent Registrars' Districts to the close of the year 1884. Since that date the ordinary geographical boundaries have been followed, and in the Abstracts in this Report the number of deaths will be found recorded for the entire decade in accordance with this latter arrangement.

Arranging the provinces from the lowest death-rate to the highest, it appears that the average annual rates per 1,000 living were as follow:—

Connaught,	13·9	Ulster,	18·0
Munster,	17·3	Leinster,	20·8

In the following statement the counties are arranged in order according to their death-rates from the lowest to the highest:—

Ireland, 17·9.

It will be here again observed that the counties containing large towns occupy unfavourable positions on the list.

This is especially noticeable when Mayo and Dublin, which occupy the extremes of the list, are contrasted with one another; the rate of mortality in the former being only about half of that in the latter.

In Tables X. and XI., pages 19 and 20, the Superintendent Registrars' districts have been classified into those containing towns with over 10,000 inhabitants, and those which do not contain any large towns. The former may for convenience be called "Civic," the latter "Rural" Unions.

If the death-rates in those two groups of districts be contrasted, it will be observed that the average death-rate for the "Civic" group is 223·2 per 10,000 inhabitants per annum; whereas in the "Rural" group it is but 160·4, or 62·8 less. In round numbers, therefore, the deaths among a million of inhabitants of such an urban population would exceed those of a rural population of the same amount by about 6,000 per annum. If the rural population of Ireland died at the same rate as the urban there would be an average increase of about 22,000 deaths in Ireland per annum.

In considering the causes of death and their distribution throughout Ireland, a further and more detailed reference will be made to these remarkable contrasts between civic and rural death-rates.

[Table.

TABLE X. TOTAL DEATHS and DEATHS from several causes registered during the Ten Years 1881–90 in those UNIONS or SUPERINTENDENT REGISTRARS' DISTRICTS containing Towns which in 1881 or in 1891 had a population of 10,000 or upwards; with a SUMMARY thereof for each PROVINCE.

* Unions or Superintendent Registrars' Districts containing Towns which in 1881 or in 1891 had a population of 10,000 or upwards.
† All Unions other than those specified in Note (*).

Urban Sanitary Districts.

Separate statistics for the Urban Sanitary Districts, compiled from Weekly and Quarterly Returns furnished by the various Registrars, are given in Table XII.

The average annual death-rate per 1,000 of the mean population (1881–91) in these districts, which comprise a population of nearly one-fourth of the total of the country, was 24·1, and the birth-rate 27·9; in the remainder of the country the death-rate was 16·1, and the birth-rate 22·0 per 1,000.

The average annual rate represented by the deaths from the Principal Zymotic Diseases † in the Urban Sanitary districts during the ten years was 2·7 per 1,000 of the mean population; in the remainder of the country the rate was 1·1 per 1,000.

Table XII.—Births and Deaths registered during the Ten Years 1881–90, in the Dublin Registration District, and in each of the Provincial Urban Sanitary Districts in Ireland (exclusive of Deaths in Public Institutions of Persons admitted from other localities), with the number of Deaths from each of the Principal Zymotic Diseases.†

Note.—"The Dublin Registration District," which consists of the City of Dublin and its Suburban Districts, comprises the Urban Sanitary Districts of Dublin Clontarf, Drumcondra, Clonliffe and Glasnevin, Kilmainham, Rathmines and Rathgar, Pembroke, Blackrock, and Kingstown, and portions of the rural parts of the Poor Law Unions in which these Districts are situated. The details for it and for each of the fifteen Urban Sanitary Districts marked thus (*) in the following Table have been compiled from the Weekly Returns furnished by the Registrars.

Provinces and Urban Sanitary Districts.	Census Statistics of Districts.		Registration, 1881–90.

† See note (†) on preceding page.

Note.—Listowel, Carrickfergus, Letterkenny and Warrenpoint were constituted Urban Sanitary Districts in the year 1884; Cootehill in 1886; Navan, Clonakilty, Kilrush and Dromore in 1887; Killiney and Ballybrack in 1888; and Ballymoney, Clones, and Tanderagee in 1889. Accordingly the rates have been calculated for the respective periods of the existence of each District,

CAUSES OF DEATH.

I.—ZYMOTIC DISEASES.

The principal Zymotic diseases, namely, small-pox, measles, scarlet fever, diphtheria, whooping-cough, fever (including typhus, enteric, and simple continued fever), diarrhœa (including dysentery), and simple cholera caused 70,717 deaths during the decade, or at the average annual rate of 14·3 per 10,000 of the mean population. Of these, 33,272, or 47·0 per cent., equivalent to a rate of 22·9 per 10,000, occurred in the civic Unions (already described), and 37,445 or 53·0 per cent., equivalent to a rate of 10·7 per 10,000, occurred in the rural Unions. The general mortality of the civic districts as compared with rural is as 1·4 to 1, while in the case of the principal zymotics the ratio between civic and rural districts is 2·1 to 1, showing a very considerable excess for the civic districts beyond the rural death-rate. This difference is easily accounted for by the manner in which these zymotic diseases are promoted. With the exception of some of the forms of diarrhœa all the principal zymotics are infective diseases, and their main promoting cause is infection from person to person either directly or indirectly. Hence density of population is probably the most important factor in favouring the spread of the principal zymotic diseases, and therefore the denser the population the greater, more minute, and more constant must be all the precautions taken against the spread of infective disease. The high death-rate from certain forms of zymotic disease in town as compared with country districts, and the rates in the several districts in the former group compared one with another, will be again referred to when discussing separately the mortality from these diseases.

Small-pox.

During the decade Small-pox caused only 241 deaths, as compared with 7,550 in the previous decade. As in the former decade, the disease was very unevenly distributed throughout Ireland, both as to time and place. During the year 1881 there were 72 deaths; in 1882 the number rose to 129, the highest during the decade; for the years 1883, '84, '85, '86, '87 and '88 the deaths were respectively 16, 1, 4, 2, 14, and 3. In the years 1889 and 1890 there were not any deaths from this disease. Of the 241 deaths no less than 206 were in Unions containing large towns, and only 35 in country districts or small towns. Of the 206 deaths in the civic Unions there were in the province of Leinster only 20, of which 14 were in the South Dublin Union, 4 in Rathdown, and 1 each in the North Dublin Union and Drogheda Union; in Munster 31 deaths, of which 28 were in the Waterford Union and 3 in Cork. In Ulster at one time in the year 1882 the disease became prevalent in Belfast Union, where, during the decade, it caused 119 deaths. In Londonderry there was an outbreak causing 11 deaths, and deaths were recorded in Armagh, Lisburn, and Lurgan to the number of 10, 8, and 7, respectively. There were not any deaths in the town districts of Connaught. The 35 deaths in the rural Unions were—Antrim 2, Ballina 4, Ballymoney 1, Bandon 1, Clonakilty 2, Clonmel 2, Cookstown 1, Downpatrick 1, Dromore West 1, Dunfanaghy 2, Enniskillen 2, Glennamaddy 3, Larne 2, Mitchelstown 1, Mullingar 5, Newtownards 4, and Tullamore 1.

From the foregoing statement, and a reference to Tables X. and XII. (the latter showing statistics of births, deaths, and principal zymotic diseases in the urban sanitary districts of Ireland) it is seen that there was not any general epidemic of small-pox in Ireland during the decade, that the only places where the disease appears to have prevailed to a considerable extent were Belfast and Waterford, and that in neither of these towns did the disease assume serious proportions.

The number of deaths from small-pox was so small—being only 0·27 per 1,000 of the total deaths from all causes in Ireland during the decade—that the stating of rates for particular periods of life, as was done in the previous Decennial Summary, would not convey any valuable information.

There has always been a considerable difficulty in obtaining complete information as to whether persons dead of small-pox had or had not been vaccinated. Thus, of the 241 deaths recorded as caused by small-pox, in 131 the conditions as to vaccination are not stated. In the other cases it is stated that 74 were vaccinated and 36 unvaccinated. Under these circumstances an analysis of the statistics would not lead to any trustworthy conclusion.

In the Decennial Report for the years 1871–80 the want of more accurate records of

vaccination was noticed. This defect has now been to a great extent remedied, and regular quarterly records of vaccination are collected and published in the quarterly reports of the Registrar-General. This system, which was commenced in the year 1882, has been continued up to the present, and shows that during the nine years, 1882–90, 895,787 primary vaccinations, and 57,705 deaths of unvaccinated children under 3 months old were recorded as compared with 1,024,616 births registered. It should be added that in the same period only 169 deaths were registered from small-pox. A Table showing the number of successful primary vaccinations by Unions will be found at page 75.

Measles.

Measles caused 9,429 deaths during the decade: Table XVI. (pages 32–3) shows that the mortality from this disease varied much in different years during the period. In 1886 there were only 284 deaths from measles registered, while in 1888, when there was a very general epidemic of this disease throughout Ireland, there were 1,935.

As to the distribution of the disease between town and country districts, the usual law followed by infective disease is observed, the mortality according to Tables X. and XI. being 3·8 per 1,000 for town and 1·1 for rural Unions. The disease was most destructive in the Dublin, Belfast, and Cork districts, in which there were 4,315 deaths, or nearly one half of all the deaths from measles in Ireland. Table XII. shows the number of deaths from measles in the Urban Sanitary Districts.

As might be expected, the disease was most destructive during the early periods of life. Of the 9,429 deaths, no less than 7,547 (3,895 males, and 3,652 females) or 80·0 per cent. occurred under the age of five years; 1,609 (910 males, and 699 females), were under one year; and 2,990 (1,569 males, and 1,421 females), between one and two years. Taking the last two years together, it may be said that about one-half (4,599 or 48·8 per cent.), of all the deaths from measles occurred in infants under two years of age, or at the average annual rate of 24·1 per 10,000 of children living at that age.

Scarlatina.

Scarlatina caused 10,311 deaths, the average annual number of deaths being 1,031, or at the rate of 2·1 per 10,000 of the population. This disease, though causing less than half as many deaths as in the previous decade, when the mortality from it was largely in excess of that from either measles, enteric fever, simple fever, or typhus fever, is still the most destructive of the infective zymotic diseases. For the ten years 1881–90, the deaths were about twice as many as those from typhus or simple fever, considerably over the number from enteric fever, and somewhat above that from measles. The greatest number of deaths from scarlatina occurred in the year 1883, when they reached 1,765; the smallest number in 1890, when they only reached 319. A reference to Tables X. and XI. shows the relative distribution of the disease between town and country. Of the 10,311 deaths, 4,932, or at the rate of 3·4 per 10,000, took place in the civic, and 5,379, or at the rate of 1·5 per 10,000 of the population, occurred in the rural Unions. Of civic Unions, the disease was most fatal in Belfast, where the rate was 4·8, in Limerick 4·7, and the North and South Dublin districts, where the rates of mortality were respectively 4·5 and 4·4 per 10,000 of the population. In Newry the corresponding rate was 4·1; in Londonderry 3·9; in Lisburn 3·6; and in Lurgan 3·2. Turning to the Urban Sanitary Districts it will be seen that 1,522 deaths from this disease were registered in the Dublin Registration District, 1,110 in Belfast, 249 in Limerick, 201 in Londonderry, 173 in Cork, and 105 in Newry.

Scarlatina, as is well known, is chiefly fatal among the very young. Thus a reference to the Abstract (pages 85–9) shows that 639 of the deaths were in children under one year; 1,275 between the ages of one and two years; 1,356 between two and three; 1,281 between three and four; 1,099 between the ages of four and five; making a total of 5,650 deaths under the age of five years or at the average annual rate of 10·8 per 10,000 living at that age. Between the ages of five and ten years there were 3,077 deaths, so that 8,727 or 84·6 per cent. of the total deaths from scarlatina were of children under ten years old, or at the rate of 8·0 per 10,000 living at these ages. If we add to this number 899 more deaths between the ages of ten and fifteen, we have 9,626, or 93·4 per cent. of all the deaths from scarlatina among children, or at the rate of 5·8 per 10,000 of the children in Ireland. The full fatality of scarlatina is by no means represented by these figures, as this is one of those diseases which lay the foundation of many other secondary ailments, many of which prove fatal at periods long subsequent to the acute attack of the disease.

Diphtheria.

Diphtheria caused 3,465 deaths during the decade, or an average of 347 per annum, being at the rate of 0·7 per 10,000 of the population. In the preceding decade the number of deaths was 3,403. The mortality from this disease was lowest in 1883 when 239 deaths occurred, and highest in 1888 when there were 447 deaths.

In the following Unions—Clifden, Glenties, Kenmare, Killadysert, Longford, Newcastle, and Portumna—there were not any deaths from diphtheria registered during the whole decade. Most of these Unions are rather out of the way, or in remote districts. Tables X. and XI. show that diphtheria follows the usual rule of infective diseases, and prevails to a greater extent in town than in country districts, but this is not so marked as in the other forms of zymotic disease which have been already considered.

A comparison between the town districts shows that the mortality from diphtheria has been equal to an average rate of 1·3 per 10,000 of the mean population in Ulster; 0·7 in Leinster and Munster respectively; and 0·5 in Connaught. The rate for Armagh is 1·5, Belfast 1·4, Lurgan 1·4, and Lisburn 1·3. More than half of the total number of deaths in the Civic Unions of Ireland occurred in Ulster. Of the 949 deaths from this disease in the Urban Districts, 316 were in Belfast, and 267 in the Dublin Registration District.

Diphtheria, like scarlatina, is especially fatal to children. Of the 3,465 deaths, 1,673, or 48 per cent., were in children under 5 years of age, or at the average annual rate of 3·2 per 10,000 living at that age-period. Of these 1,673 there were 198 under the age of one year; 372 between 1 and 2 years; 371 from 2 to 3 years; 388 from 3 to 4 years; and 344 from 4 to 5 years. Above 5 years of age, there were 1,074 deaths between 5 and 10 years, and 324 between 10 and 15 years—making together 1,398, which with those under 5 years, gives 3,071, or 88·6 per cent., of the whole for the years of childhood.

Whooping-cough.

Whooping-cough caused 14,339 deaths during the decade, or at the average annual rate of 2·9 per 10,000 of the population. A general relation has been noticed by many observers between the prevalence of whooping-cough and measles, and there is no doubt that in many localities an epidemic of measles is frequently accompanied or followed by a prevalence of whooping-cough. A comparison of the figures in Table XVI., which represent the mortality from these two diseases, does not point to any very close relationship. Whooping-cough was a much more fatal disease in Ireland during the decade than measles, but it is more than probable that measles was equally prevalent.

Table XVI., however, does not show that an increase of measles was contemporaneous with an increase of whooping-cough. In the years 1882, 1885, and 1888, when measles increased, whooping-cough diminished, and in the years 1883 and 1889, when whooping-cough exhibited an increased mortality, measles was less fatal. It must, however, be admitted, in justice to the opinion of those who consider there is a necessary relation between one disease and the other, that the periods being calendar years, are too long and too arbitrary for exact comparison. It might naturally be expected that there would be a close relationship between the deaths from whooping-cough and those from diseases of the respiratory system. A reference to Table XVI. serves to show that there is some such relationship.

The distribution of the mortality from whooping-cough was tolerably even over the whole of Ireland. There is not any Union in Ireland whose population escaped, and in many Unions a large number of deaths took place during the decade.

Tables X. and XI. show that, like other infective diseases, whooping-cough is more fatal in town (Dublin and Belfast contributing 22·7 per cent. of the mortality from this disease) than in country districts but the difference is not so well marked as in the cases of small-pox, measles, and scarlatina, already referred to.

A reference to the Abstract, pages 88–9, shows whooping-cough to be, so far as mortality is concerned, almost essentially a pest of childhood, especially of early childhood. Of the 14,339 deaths, no less than 12,988, or 90·6 per cent., were in children under 5 years of age, or at the rate of 24·8 per 10,000 of those living at that age; of these, 5,491, or 42·3 per cent., were under 1 year of age, or at the rate of 56·1 per 10,000 of children born. Between the ages of one and two years, the deaths numbered 3,934, or 30·3 per cent. of the total, being equal to an average annual rate of 46·9 per 10,000 of children living at that age. From this age the proportion of deaths at each age decreases rapidly, there being but 1,887 between the ages of two and three years; 1,030 between three

and four years; and 646 between the ages of four and five years; on passing the age of five there were 1,176 between five and ten years; and only 149 between the ages of ten and fifteen years, with the insignificant number of 26 above the age of fifteen. Excepting, perhaps, the case of croup, this is the most remarkable instance of a disease the mortality from which is almost exclusively confined to early childhood.

Fevers.

In former times several diseases were collectively described under the term "Fever," and in the earlier reports of this department four forms of disease, namely, typhus, enteric, relapsing, and simple continued fevers are dealt with under the single head "fever"; however, during the two decades 1871-80 and 1881-90, these diseases (except relapsing fever in the first decade) have been dealt with separately and tabulated under their respective heads in the annual reports. "Typhus" is promoted if not caused by overcrowding of human beings. "Enteric or typhoid fever," the promoting cause of which is usually recognised as attributable to defective drainage and sewerage, has for the last twenty-five years been more common in Ireland than typhus, although apparently it was not so formerly. "Relapsing fever," which arises in connexion with scarcity of food, and which is hence called "Famine fever," has at certain times prevailed in Ireland, but has not been classified as a cause of death in the Reports for the years 1871–80, and probably did not occur at all, or only in a very few isolated cases during that period, but twenty-two deaths were registered as occurring from it in the decade 1881–90. "Simple continued" fever, no doubt, comprises imperfectly developed forms of the three first mentioned specific fevers, and many high authorities decline to recognise simple continued fever as a specific form of disease, nevertheless, during the decade, very many deaths were attributed to this cause.

Table XIII., contains a summary by ages of the deaths from the three forms of continued fever dealt with in the Abstracts.

Table XIII.—Deaths at each of Eleven Age-Periods from the several forms of Continued Fever registered in Ireland during the Ten Years 1881–90, with the Ratio of the average annual number of these Deaths to every 100,000 of the living at the same age.

Age-Periods.	No. of Deaths registered.				Average annual number of Deaths to 100,000 of the living at same age.			
	Typhus.	Typhoid or Enteric Fever.	Simple and Ill-defined Fever.	Total.	Typhus.	Typhoid or Enteric Fever.	Simple and Ill-defined Fever.	Total.

65 „ 75,	286	186	337	809	14·13	9·19	16·65	39·97
75 and upwards,	86	59	161	306	7·90	5·42	14·80	28·12
Total,	5,457	7,995	4,615	18,067	11·05	16·18	9·34	36·57

During the decade 1881–90, the total number of deaths from continued fevers (typhus, enteric and simple and ill-defined fevers), was 18,067 as compared with 30,092 for the previous decade, the rates per 100,000 of the mean population being respectively 36·57 and 56·88, showing a large diminution, both absolutely and relatively, in the mortality from this group of zymotic diseases.

Typhus caused 5,457 deaths, or, at the rate of 11·05 per 100,000, as compared with 7,495 deaths, and a rate of 14·17 for the previous decade. Enteric or typhoid fever caused 7,995 deaths, or at the rate of 16·18 per 100,000 of the mean population, as compared with 9,746, and at a rate of 18·42 for the previous decade. Simple continued and ill-defined fever caused 4,615 deaths, or at the rate of 9·34 per 100,000 of the mean population, as compared with 12,851, and a rate of 24·29 for the decade 1871-80.

It will thus be seen that, while the rate of mortality per 100,000 of the mean population from simple continued and ill-defined fever has fallen from 24·29 to 9·34, or to the extent of 14·95, the rates for typhus and enteric fever have only fallen by the respective

rates of 3·12 and 2·24. This remarkable difference may be fairly accounted for by advances in diagnosis, by which many cases of disease, which formerly would have been classified as simple fever, were more correctly defined in the death certificates. It is, however, very gratifying to note that the death rates from all forms of continued fever, whether taken separately or collectively, have materially diminished during the later as compared with the earlier decade.

An investigation into the relative number of deaths at different ages in typhus and enteric fever is very interesting. Table XIII. sets out these deaths by 11 age-periods. Under five years the proportion of deaths from typhus is smaller than at any other period of life—indeed it is almost insignificant—while in enteric fever it is very large; after this period of life the death-rate from typhus increases materially, and remains high as life advances, while in the case of enteric fever the highest rate of mortality is reached at the age-periods 15–20 and 20–25, and then it materially diminishes. In the case of simple fever the rate of mortality steadily increases as age advances, reaching its maximum in advanced life. Many of the deaths attributed to this disease in advanced life are so designated, owing to the fact that in many cases death from senile decay is accompanied by a form of fever sometimes described as "febris senilis."

The distribution of the various forms of fever throughout Ireland is shown in the Abstracts at p. 96–103. The more remarkable features are shown in Table X., from which it will be seen that the greater number of deaths from the different forms of continued fever are to be found in towns. Thus of 18,067 deaths from fever, 7,264 occurred in large town districts—the rate of mortality for continued fever being, for the whole of Ireland, 3·7; for districts containing large towns, 5·0; and for rural districts, 3·1 per 10,000 inhabitants, as compared with 5·7, 7·2, and 5·1 respectively for the preceding decade.

When the distribution of the different forms of continued fever between town and country is considered, it will be seen that the town exceeds the country death-rate in the cases of typhus and enteric fever; but in the case of simple and ill-defined fever the country rate exceeds the town rate. In the case of enteric fever the town rate is more than double that for the rural districts, and the typhus town rate is nearly double the rural rate.

If the Unions comprising the great towns of Dublin, Belfast, and Cork be treated as a group, it will be found that of the 5,457 deaths from typhus, 1,432, or 26·2 per cent., occurred in these districts taken collectively; and in the case of enteric fever, of the 7,995 deaths, 3,082, or 38·5 per cent., took place in these great town districts. These town districts have a population of 808,047, or 16·4 per cent., of the total inhabitants of Ireland. If the various town districts be compared with one another, it will be found that in those of Leinster, whether taken individually or collectively, the death-rate from enteric fever exceeds the death-rate from typhus. The same is true of Ulster; but in the case of the town districts of Munster and Connaught it is the reverse, as in every case in the western and southern provinces, the death-rate from typhus exceeds that from enteric fever. The highest death-rate from typhus fever is found in Waterford Union, where it reached 3·5 per 10,000 of the mean population, Cork coming next with a rate of 3·0. The highest death-rate from enteric fever was in the North Dublin Union, where the rate reached was 4·7, the Belfast and South Dublin Unions standing next in order with death-rates of 4·5 and 3·9 respectively. The combined enteric fever deaths for the three Dublin Unions, including the whole town district of Dublin, represent a rate of 4·0 per 10,000, being about the same as Belfast. Thus the two greatest towns in Ireland appear to be the chief foci of enteric fever, while the chief foci of typhus are found in less important places; and, as shown in the Abstract, this disease has caused many deaths in rural districts.

ERYSIPELAS

Erysipelas caused 2,421 deaths during the decade, being an average of 242 per annum, or at the annual rate of 0·5 per 10,000 of the mean population.

The number and proportion of males who died of erysipelas are greater than those of females, although females preponderate in the population of Ireland. 1,345 males and 1,076 females died of erysipelas, being at the respective average annual rates of 0·6 per 10,000 of the male population, and 0·4 per 10,000 of the female population. The deaths of males amounted to 55·6 per cent., and those of females to 44·4 per cent. of the total deaths.

The greater proportion of deaths from erysipelas among males than females may be accounted for—firstly, by the fact that many deaths from erysipelas are probably due to that disease supervening on injuries (often of a slight nature) to which men, from the nature of their occupations, are more liable than females; secondly, intemperate persons are more prone to die of erysipelas than sober people, and as there are more intemperate men than intemperate women this condition also accounts for the excessive male death-rate. Of the 2,421 deaths from erysipelas—340 were among infants under one year of age, or equal to a rate of 3·5 per 10,000 of children born, and forming 14·0 per cent. of the total deaths from the disease; the number in each succeeding year of early life is small, the total under five years being 454, or at the average annual rate of 0·9 per 10,000 living at that age, and equal to 18·8 per cent. of the total. There were in all 541 deaths from erysipelas under ten years of age, or 22·4 per cent. of the total. After the age of twenty-five years the rate of mortality is found to rise very considerably, and by far the larger proportion of deaths occurs after this period, especially when middle life is passed. The deaths between twenty and forty-five years amount to 412, or 17·0 per cent. of the total deaths from this cause, being at the rate of 0·3 per 10,000 of the mean population at these ages. The number between the ages of forty-five and sixty-five is 662, or at the rate of 0·8 per 10,000, and from sixty-five to eighty-five 604, or at the annual rate of 2·1 per 10,000 of the mean population, thus showing a steady increase of mortality towards advanced life.

Puerperal Fever and Childbirth.

It is difficult completely to separate the statistics of deaths from puerperal fever and from childbirth, as they may be all put down to a common cause, namely, parturition, and no doubt a considerable number of deaths from puerperal fever, especially in the country, are returned simply as deaths from "childbirth."

The total number of deaths under these two heads was 8,126, or at the annual rate of 15·0 per 10,000 of married women within the child-bearing ages (namely, 15 to 55). The deaths from puerperal fever numbered 3,251, or at the rate of 6·0 per 10,000 of married women at the child-bearing ages, and the other deaths from childbirth numbered 4,875, or at the rate of 9·0 per 10,000 at the same age-periods. The deaths from puerperal fever were at the rate of 2·8 per 1,000, and those from childbirth at the rate of 4·3 per 1,000 of the births registered, the two combined being equal to one in 142, or at the rate of 7·1 per 1,000 of the births registered.

The Abstract (pages 96–103) shows that in every Union in Ireland, except Ballyvaghan, deaths from puerperal fever were recorded; and that deaths from other forms of the affections of childbirth were recorded in all Unions. Tables X. and XI. show the relative distribution of deaths from this group of disease between town and country. A result is shown by this comparison which differs remarkably from the results obtained where the town and country death-rates are compared for any of the other diseases or groups of diseases dealt with in these Tables. The average annual death-rates to the population from puerperal fever and childbirth combined are almost the same in town and country, namely, 1·9 and 1·6 per 10,000 respectively; taken separately, the death-rate from puerperal fever, which is an infective disease, is slightly higher in town than in country, and in other forms of death from childbirth the mortality is also greater in town than in the country.

If the number of these deaths be compared with the number of births registered we have the result as set out in the following statement:—

Ten Years 1881–90.

"Puerperal Fever" and "Childbirth" in "Civic" and "Rural" Unions.

In Civic Unions	Deaths from	Puerperal Fever	=	1 in 321 or 3·1	per 1,000 *Births* registered.
" Rural "	"	"	=	" 373 or 2·7	" " "
" Civic "	"	Childbirth	=	" 252 or 4·0	" " "
" Rural "	"	"	=	" 229 or 4·4	" " "
" Civic "	"	Puerperal Fever and Childbirth combined	=	" 141 or 7·1	" " "
" Rural "	"	"	=	" 142 or 7·1	" " "
Total Deaths from		Puerperal Fever	=	" 354 or 2·8	" " "
"		"Childbirth"	=	" 236 or 4·3	" " "
"		Puer. Fever and Childbirth combined	=	" 142 or 7·1	" " "

From this it appears that the relation of deaths from puerperal fever and childbirth combined to births registered is, for the whole of Ireland, at the rate of 1 in 142, or 7·1 per 1,000; for puerperal fever alone, it is 1 in 354 or 2·8 per 1,000; and for childbirth 1 in 236, or at the rate of 4·3 per 1,000 births. If, however, town and country are compared, it appears that the mortality from puerperal fever in town districts is at the rate of 1 in 321, or 3·1 per 1,000 births, while in country districts it is 1 in 373, or 2·7 per 1,000, being somewhat less. On the other hand, the deaths from "childbirth" are proportionately less in town than in country; in the civic districts the rate is 1 in 252, or at the rate of 4·0 per 1,000, while in country districts it is 1 in 229, or 4·4 per 1,000 births. If the two be taken together the result is, that deaths from parturition are at the rate of 7·1 per 1,000 births both in town and country districts.

The ages at which deaths in child-bed occur must be considered on different principles from those followed in considering deaths by ages with reference to other forms of disease. Taking the widest range, it may be said that all child-bearing women are comprised between the ages of 15 and 55 years, though the number must be very small towards the latter period. In order to set out the relative liability to death from childbirth at various periods of life, the following statement has been drawn up:—

TABLE XIV.—DEATHS from PUERPERAL FEVER and "CHILDBIRTH," 1881–90.

—		Age-Periods. 15–20.	20–25.	25–35.	35–45.	45–55.	Total 15 to 55 years.
Married Women, Census of 1881,		3,345	43,192	182,380	203,381	142,560	574,858
" " 1891,		2,447	33,398	151,980	170,622	147,640	506,087
Mean,		2,896	38,295	167,180	187,002	145,100	540,473
Deaths from Puerperal Fever,	Total Number in Ten Years, 1881–90,	85	495	1,681	932	58	3,251
	Average Annual Rate per 10,000 Married Women of same age,	29·3	12·9	10·1	5·0	0·4	6·0
Deaths from "Childbirth,"	Total Number in Ten Years, 1881–90,	70	446	2,094	2,103	162	4,875
	Average Annual Rate per 10,000 Married Women of same age,	24·2	11·6	12·5	11·2	1·1	9·0
Total Deaths from Puerperal Fever and "Childbirth,"	Total Number in Ten Years, 1881–90,	155	941	3,775	3,035	220	8,126
	Average Annual Rate per 10,000 Married Women of same age,	53·5	24·5	22·6	16·2	1·5	15·0

The above comprise all the registered deaths from puerperal fever, and, with two exceptions, those from the accidents of childbirth. The two deaths from the accidents of childbirth were of persons aged "55 years or upwards."

From this statement it appears that between the ages of 15 and 20 years the average annual death-rate from puerperal fever and childbirth combined during the decade was at the rate of 53·5 per 10,000 of the mean number of married women living at those ages; between the ages of 20 and 25 the rate was 24·5; from 25 to 35 years it was 22·6; from 35 to 45 years it was 16·2; and from 45 to 55, when child-bearing has nearly ceased, the rate was only 1·5. Thus the risks of child-bed appear to diminish as the period of married life increases, and are materially greater among very young wives. This tendency is more marked in the case of puerperal fever than in other forms of death in child-bed. In puerperal fever the death-rates are, from 15 to 20 years, 29·3; from 20 to 25 years, 12·9; from 25 to 35 years, 10·1; from 35 to 45 years, 5·0; and from 45 to 55, 0·4; the average rate being 6·0. In other forms of death in childbed the rates are—from 15 to 20 years, 24·2; from 20 to 25 years, 11·6; from 25 to 35 years, 12·5; from 35 to 45 years, 11·2; and from 45 to 55 years, 1·1; the average rate being 9·0. Thus the risks of death from puerperal fever and childbirth are very much greater among young wives, and steadily diminish as life advances.

During the previous decade the total deaths from puerperal fever and childbirth combined represented a rate of 15·3 per 10,000 of the mean number of married women living at child-bearing ages; thus the death-rate from these forms of disease, taken collectively, has slightly decreased, the fall of rate being 0·3 per 10,000. The death-rate from puerperal fever, however, rose from 5·8 in the previous to 6·0 in the later decade, while in other forms of deaths in childbed the rate fell from 9·5 to 9·0. When the numbers for 1871–80 are analysed and compared with those for 1881–90, and each

with the number of births registered, it will be found that, whether in town or country, whether from puerperal fever or from the accidents of childbirth, there has been a general increase all round.

Influenza.

The deaths from Influenza amounted, during the decade, to 2,096 (1,067 males and 1,029 females), or at the average annual rate of 0·4 per 10,000 of the mean population.

During the preceding decade the number of deaths from this disease was comparativly insignificant, amounting to but 972, being an average annual mortality at the rate of only 0·2 per 10,000: during the whole period from the commencement of death registration in Ireland up to the year 1890, the average number of deaths was only 103 per annum. During the whole of that period there was not any epidemic noticeable, but in the year 1890, which concluded the decade now under consideration, the disease assumed a serious form and prevailed as an epidemic cauing no less than 1,712 deaths, or at the rate of 3·6 per 10,000 of the estimated population. Since that period up to the date of this report, the disease has prevailed in a more or less epidemic form, but the statistics with reference to its prevalence and mortality, after the termination of the year 1890, do not come within the scope of this report. A reference to pp. 14 and 15 of the Annual Report of Marriages, Births, and Deaths for the year 1893, will give the fullest available information on this subject.

Bowel Affections.

Under the class of zymotic diseases in the order "Miasmatic disease" are found dysentery and diarrhœa, and simple cholera. There was not any invasion of Asiatic cholera during the decade. Simple cholera, or, as it is sometimes called English cholera, or *Cholera nostras*, can only be viewed as a severe and active form of diarrhœa; it cannot be said to have any characters which distinguish it specifically from other forms of fatal diarrhœa which occur in this country. Dysentery, although not so ill-defined as "simple cholera," is nevertheless a disease which in this country is generally of a chronic character or some form of diarrhœa with dysenteric symptoms. Therefore in dealing with these three causes of death it seems advisable to treat them together as "bowel affections." Taking them in this way it is found that collectively they caused 14,865 deaths, or at the average annual rate of 3·0 per 10,000 of the mean population. Diarrhœa and dysentery caused 14,430, and cholera 435 deaths, being at the respective rates of 2·9 and 0·1 per 10,000 of the mean population. Thus the deaths ascribed to diarrhœa and dysentery are 97·1 per cent. of this group.

The deaths from diarrhœa and allied diseases were generally distributed throughout Ireland, as shown in the Abstract (pages 96–103). Tables X. and XI. show that the mortality from diarrhœa and dysentery was much greater in proportion in the town than in the country districts, being at the respective rates of 5·3 and 1·9 per 10,000 of the mean population, or nearly three times the rate in the former as compared with the latter. The relative preponderance of the death-rate from diarrhœa and dysentery in town over the country districts is greater than in any other form of zymotic disease, except measles, and yet the infective power of diarrhœa is comparatively slight as compared with that for the fatal zymotics hitherto discussed.

It is found that of the 14,430 deaths from diarrhœa and dysentery, no less than 5,510 or 38·2 per cent. were in the three great town Unions of Ireland, namely, 2,774 in Dublin, 2,152 in Belfast, and 584 in Cork (including Queenstown). The case of Belfast is the most unfavourable, where the deaths from diarrhœa were at the annual rate of 8·1 per 10,000 of the mean population, and contributed 14·9 per cent. of all the deaths from diarrhœa in Ireland. In several other Civic Unions in Ireland, the death-rate from diarrhœa was also of a serious amount per 10,000, thus: in Dublin it was 8·0 (or about the same as Belfast) for the North, and 7·0 for the South Union Districts; in Kilkenny 4·3, Cork 4·2, Limerick 4·0, Waterford 6·6, Lisburn 3·8, and Lurgan 4·4. Somewhat over half of the whole mortality from diarrhœa occurred in the town districts, and, as will be presently shown, the great bulk of the deaths occurred among young children.

The Abstract (pages 88 and 89) shows the ages at which deaths from diarrhœa occurred. The number of deaths from this cause under one year of age was 4,363, or 30·2 per cent. of the whole, or at the rate of 37·9 per 10,000 of children born: the number between the ages of one and two years was 1,498; from this age the death-rate

from this disease falls rapidly till middle life is reached, but it shows a considerable tendency to increase in fatality when middle life is passed. There were 6,969 deaths from diarrhœa in children under five years of age, being 48·3 per cent., or nearly one half of the total mortality from this disease, or at the average annual rate of 13·3 per 10,000 living at that age-period. These 6,969 deaths mainly occurred among the children of the large town populations, as has already been pointed out when considering the distribution of the disease between town and country districts.

The general result of a comparison of the deaths from these diseases during the decades 1871–80 and 1881–90 is that a material diminution in the rate has taken place almost everywhere—the general rate for Ireland having fallen from 4·0 per 10,000 persons to 3·0.

Parasitic Diseases.

In this class thrush caused 259, and worms and other parasitic diseases 700 deaths, nearly all among children.

Alcoholism.

The number of deaths caused by the abuse of alcoholic drinks cannot be accurately stated, owing to the fact that there are many diseases which are promoted by and sometimes owe their origin to the excessive consumption of alcohol, and the deaths from which are returned under the heads of the special organs affected. Thus alcohol is no doubt accountable for many deaths from kidney, liver, and brain diseases, but there is no reason to suppose that the larger proportion of diseases of these organs are so caused. In filling death certificates for deaths from such causes, the certifying medical practitioner in the majority of cases does not attach any qualifying word to the cause of death implying that the origin of the disease was alcoholic. Thus, in dealing with the statistics of death from alcoholic causes, we have only two heads under which they can be grouped—these heads are "Delirium Tremens" and "Intemperance," the latter term being rather indefinite. In Table XV. the number of deaths from these two specified causes are dealt with.

Table XV.—Deaths from Alcoholism.

Year.	Delirium Tremens.			Intemperance.			Total. Delirium Tremens and Intemperance.		
	M.	F.	Total.	M.	F.	Total.	M.	F.	Total.
1881,	36	–	36	99	15	114	135	15	150
1882,	43	1	44	92	16	108	135	17	152
1883,	42	5	47	100	23	123	142	28	170
1884,	54	9	63	79	23	102	133	32	165
1885,	47	5	52	84	18	102	131	23	154
1886,	42	2	44	85	22	107	127	24	151
1887,	25	9	34	81	10	91	106	19	125
1888,	34	4	38	77	23	100	111	27	138
1889,	33	1	34	89	25	114	122	26	148
1890,	33	2	35	91	17	108	124	19	143
Total,	389	38	427	877	192	1,069	1,266	230	1,496

From this statement it would appear that during the decade under consideration there were 427 deaths from "delirium tremens," and 1,069 from conditions directly caused by alcoholic excess, making a total of 1,496 deaths directly due to alcohol. Comparing the numbers specified from year to year, it would appear there is but little variation. If the numbers are compared with those for the previous decade 1871–80, they do not present any appreciable variations as to their relation to the population, the average annual ratio per million of the mean population being 30·4 in the first and 30·3 in the last decade. So far as the figures go, while they do not point to any advance in temperance, they do not show that intemperance has increased. Compared with the previous decade it would appear that "delirium tremens" as a cause of death among men has considerably diminished, while among women it has very slightly increased. In the case of other forms of deaths directly resulting from intemperance the mortality among men has slightly increased, while among women it has diminished.

CAUSES OF

II.—CONSTITUTIONAL DISEASES.

This class of diseases is not now, as formerly, divided into orders, but constitutes a group without regular sub-classification of the various specific forms of disease which it includes—viz., rheumatism, rheumatic fever, and rheumatic carditis, gout, rickets, cancer, tabes mesenterica, tubercular diseases (which may be taken to include tubercular meningitis or acute hydrocephalus), phthisis or pulmonary consumption with other forms of tuberculosis and scrofula, purpura and hæmorrhagic diathesis, anæmia, chlorisis and leuco-cythæmia, diabetes mellitus, and some other constitutional diseases. Dropsy was formerly specified under this class; but dropsy, being a consequence of other forms of disease, has now been omitted, and would take its place, according to circumstances, under the head of the disease which caused it, such as disease of the heart, liver, or kidney.

Cancer caused 20,036 deaths (8,964 males and 11,072 females) during the decade, being 2·28 per cent. of the total deaths, and equal to an average annual rate of 4·1 per 10,000 of the mean population for the period. During the previous decade

the corresponding statistics were:—total number of deaths, 17,790 (7,789 males and 10,001 females); percentage of total deaths, 1·84, and the death-rate per 10,000 3·4. The increasing death-rate from cancer has been noticed for many years, and has been steadily progressive, not only in Ireland, but also in the other divisions of the United Kingdom. The numbers given above show that although the population declined the deaths from cancer increased by 2,246 in the later as compared with the earlier decade, or at the rate of 12·6 per cent. The deaths among males increased by 1,175, or at the rate of 15·1 per cent., and among females to the extent of 1,071, or at the rate of 10·7 per cent. Thus the greater portion of the increase was among men, or in the sex which hitherto has been considered to be the less liable to cancer. Still the number of deaths from cancer among females is greater than among men. The greater preponderance of deaths among females seems due to the special liability of the uterus and breasts to be attacked by malignant disease.

Malignant disease is extremely rare among the young; thus there were only 37 deaths from cancer recorded among children under 5 years of age, 18 being males and 19 females. The Abstracts show that in middle life deaths from malignant disease are found to constitute a large proportion of the deaths from all causes.

PHTHISIS.

Phthisis or pulmonary consumption, or as it is popularly termed "consumption" or "decline," is the cause of more deaths in Ireland than any other single disease, and therefore should be of more interest to the physician and sanitarian than any other malady. The disease is well known to have hereditary tendencies, and is also generally, though not universally, admitted to be infective. There are considerable difficulties encountered in dealing accurately with the statistics of deaths from phthisis as many persons affected by phthisis have their lives terminated by other forms of disease, especially of pulmonary disease. Thus phthisical people, whose lungs may not at the time be extensively injured by tubercular disease, are frequently attacked by acute lung affections, such as bronchitis or pneumonia, which, acting on already unhealthy lungs, prove rapidly fatal. Such cases have the cause of death frequently certified as due to the acute disease only, although had the more chronic tuberculosis been absent the patient might have recovered. Such cases are no doubt numerous, but they tend to increase, not to diminish, the importance of tuberculosis of the lungs as a cause of death. It is clear from the foregoing considerations that phthisis and other forms of disease of the respiratory organs are so intimately mingled in the statistics of the cause of death, that it is desirable to treat them collectively when discussing this subject.

The deaths from diseases of the respiratory organs numbered 153,279 (79,591 males and 73,688 females) during the decade. Phthisis caused 103,314 (47,850 males and 55,464 females); taken collectively 256,593 deaths were attributed to these diseases, or 29·1 per cent. of the total deaths recorded in Ireland, and at the average annual rate of 51·9 per 10,000 of the mean population. Owing to an alteration in the classification, croup which was formerly included in the "miasmatic" order of diseases is now classed among the diseases of the respiratory system, and as the deaths from croup in the decade 1871–80 numbered 14,256, the deaths from diseases of the respiratory system as given in the Report for that period must, for purposes of comparison, be increased by that number, making a total of 260,775. These figures show that there was an absolute decrease of deaths from phthisis and diseases of the respiratory system combined in 1881–90, as compared with the previous decade to the extent of 4,182, but the average annual rate in proportion to the mean population rose from 49·3 per 10,000 to 51·9, and the percentage, as compared with deaths from all causes, from 27·0 to 29·1. If, however, the details are looked into it will be found that the deaths from phthisis diminished by a very little—namely, from 103,528 to 103,314. It is remarkable that this decrease occurred altogether among the male sex, in which the number decreased from 49,438 to 47,850, while the deaths among females actually increased from 54,090 to 55,464. In the deaths from diseases of the respiratory organs, exclusive of phthisis, the decrease among males was double that among females. It is very unsatisfactory to find that the death-rate from phthisis has risen from 19·6 to 20·9 per 10,000 of the mean population, and that in other diseases of the respiratory organs the rate has risen from 29·7 to 31·0.

[TABLE

TABLE XVII.—MORTALITY from PHTHISIS and from DISEASES of the RESPIRATORY SYSTEM in the Northern, Eastern, Southern, and Western LITTORAL POOR LAW UNIONS or SUPERINTENDENT REGISTRARS' DISTRICTS of IRELAND during the Ten Years 1881–90, distinguishing the Mortality in those Unions containing TOWNS which, in 1881 or in 1891, had 10,000 inhabitants, with like details for all INLAND UNIONS and for all LITTORAL UNIONS and INLAND UNIONS combined.

POOR LAW UNIONS OR SUPERINTENDENT REGISTRARS' DISTRICTS.		Mean Population 1881-91.	Mortality from Phthisis.		Mortality from Diseases of the Respiratory System.		Total Mortality from Phthisis and Diseases of the Respiratory System.	
			No. of Deaths in the 10 years 1881-90.	Average Annual Rate per 10,000 living.	No. of Deaths in the 10 years 1881-90.	Average Annual Rate per 10,000 living.	No. of Deaths in the 10 years 1881-90.	Average Annual Rate per 10,000 living.

Following the plan adopted in dealing with the geographical distribution of disease in Ireland, the Superintendent Registrars' districts have been classified into rural and civic —see Tables X. and XI. From these Tables it will be seen that the rate of mortality per 10,000 from phthisis in the civic Unions is 29·5, while in rural districts it is but 17·4. Comparing them with the corresponding rates for the previous decade, it will be found that the rates have increased almost equally in both country and town districts. It would also appear from an examination of these Tables, as also from the Abstract, that the increase of phthisis has been nearly equally distributed throughout the country, as have also the diseases of the respiratory organs other than phthisis.

Having regard to the influence of climate and aspect to the prevalence of diseases of the character now under consideration, it has been thought desirable to compare the rates of mortality from these diseases in inland localities, as compared with districts near the sea coast, accordingly Table XVII. is given making a comparison between inland and littoral districts. It so happens that in Ireland all the large towns are situated near the sea; and, therefore, in order to compare the prevalence of chest affections on the sea coast with the inland districts, it is necessary to group the districts into "rural" and "civic," and again divide them into "littoral" and "inland," and then to contrast each pair of groups. The mean population for the decade of littoral Unions of the "rural" type was 1,180,369, and of inland Unions of the same type, 2,250,835; the rates of mortality from consumption in these two groups were respectively 18·0 and 16·9 per 10,000, and the rates of mortality from other diseases of the respiratory organs 24·7 in the former, against 25·8 in the latter. Thus the mortality from both phthisis and other forms of diseases of the respiratory organs combined, is the same in littoral as in the inland Unions of the rural type.

If, in a similar manner we compare littoral and inland districts containing towns of 10,000 inhabitants and upwards, we find that the former had a mean population of 1,246,002, and the latter 262,587. The rates of mortality from phthisis being respectively 29·8 and 26·2, and from other diseases of the respiratory organs 45·6 and 35·3; thus showing the same relation does not hold in the urban as in the rural, between littoral and inland districts. It must, however, be noted that the largest towns of Ireland are all situated near the sea, and that phthisis is more prevalent in the larger than the smaller towns. It is also a noteworthy fact shown in a paper published in the Proceedings of the Academy of Medicine in Ireland for 1887, that country districts surrounding large towns and even at some considerable distances from urban centres, show a higher death-rate from Phthisis than those rural districts remote from large towns, which is probably owing to the spread of the disease by infection from the large towns, and also by persons from towns going into the country to die among their friends. It is also pointed out in the same paper that the disease is more prevalent in the eastern than in the western parts of Ireland, and it is stated that "it would therefore appear that the higher civilization favours the prevalence of phthisis."

In Table XVII. is also shown the influence of aspect on the prevalence of chest affections. The littoral districts have been arranged into northern, eastern, southern, and western, and are again divided into civic and rural. It will be observed that independent of the influence of towns chest affections are more destructive in the eastern than in any other group of districts, the rate of mortality per 10,000 (excluding civic districts) being eastern, 53·6; southern, 45·3; northern, 38·1; and western, 36·9. If consumption be taken alone the rates per 10,000 are eastern, 26·1; southern, 17·4; northern, 16·9; and western, 14·3. If diseases of the respiratory organs other than consumption be taken alone the rates per 10,000 are southern, 27·9; eastern, 27·5; western, 22·6; northern, 21·2. In this case the southern group claims the largest ratio of mortality from lung affections: possibly the difference may be caused by the presence of a considerable number of small towns as the populations of the southern and eastern rural littoral groups are nearly equal, and therefore a slight increase of town population even in small towns would turn the scale against the southern group of districts. To go still further into detail it will be found on reference to Table XI., that the mortality from consumption and diseases of the respiratory organs in districts containing the largest towns is proportionally higher than in those containing the smaller towns. Thus, in the Belfast district, the mortality from consumption is the highest in Ireland, being at the annual rate of 37·2 per 10,000, the two Dublin districts come next, being at the rate of 36·3 and 34·6 respectively; the rate for Cork is 29·4, for Waterford 26·9. In the case of Belfast it is probable that the occupation of the people may have much to do with the excessive death-rate from consumption, for in the districts of Lurgan and Lisburn where the people follow similar industries, the respective rates are 32·2 and 30·7, being higher than the rate for any other district in Ireland, except Belfast and Dublin.

Tubercular Diseases.—These diseases formerly constituted the second order of the class of constitutional diseases, but this classification being abolished the various tubercular diseases are now treated as separate items. Among these the most important are—Tabes mesenterica (or Infantile decay), which caused 10,596 (5,228 males and 5,368 females) deaths; Tubercular meningitis or Acute hydrocephalus (commonly called acute water on the brain), which caused 9,458 (5,206 males and 4,252 females); and Phthisis or pulmonary consumption which caused no less than 103,314 (47,850 male and 55,464 female) deaths during the decade. Thus these three forms of tubercular

disease or rather tubercular disease affecting three portions of the body caused 123,368 deaths or 14·0 per cent. of the total mortality of Ireland for the decade. By far the most destructive of the three was phthisis or pulmonary consumption, the deaths from which constitute 11·7 per cent. of the mortality for the decade.

Of the 10,596 cases of tabes mesenterica 8,236 (4,135 males and 4,101 females), or about four-fifths, were in young children under five years of age, hence the popular name "Infantile decay."

Of the 9,458 deaths from Tubercular Meningitis 5,596, or more than one-half were also in children under five years of age; it is remarkable that deaths among young boys (under five) numbered 3,244, while among girls the mortality only amounted to 2,352, or about one-third less. We have here two forms of tubercular disease among the most destructive diseases of childhood.

III.—LOCAL DISEASES.

Local Diseases caused 362,255 deaths during the decade, being 41·0 per cent., or more than two-fifths of the total deaths, as compared with 331,744 in the previous decade. These diseases are divided into ten orders, which caused deaths as follows—Diseases of the nervous system, 83,514; of the organs of special sense, 494; of the organs of circulation, 50,800; of the respiratory organs, 153,279; of the digestive organs, 46,776; of the lymphatic system and ductless glands, 458; of the urinary organs, 15,156; of the reproductive system (organs of generation, 1,712; of child-birth, 4,877); of the organs of locomotion, 2,684; and of the integumentary system, 2,505.

Diseases of the Nervous System caused 83,514 deaths during the decade. Of these 44,772, or 53·6 per cent., were males, and 38,742, or 46·4 per cent., females, showing a great preponderance of the former over the latter. During the previous decade the numbers were males, 47,308; females, 38,190; total 85,498; the proportion being 55 males to 45 females. A reference to the Abstract (pp. 90–1), shows that the order entitled diseases of the nervous system includes several affections which are altogether diseases of the brain, such as cephalitis, apoplexy, and insanity, and several others, which are *generally* owing to diseases of the brain, such as paralysis, and, again, others which may be secondary affections resulting from other diseases or irritations, such as convulsions in children, chorea, and epilepsy. As the deaths ascribed to convulsions constitute the great bulk of this group, a fair idea of the prevalence of brain disease may be obtained by deducting convulsions from the total and leaving the balance to represent the proportion of deaths from brain disease.

The following statement has been drawn up upon this principle, and represents generally the number of deaths from brain disease and convulsions for each year during the decade 1881–90.

Table XVIII.—Deaths from "Convulsions," and Total Number of Deaths from all "Diseases of the Nervous System," in Ireland in each of the Ten Years, 1881–90.

Year.	Deaths from Convulsions.			Deaths from *all* "Diseases of the Nervous System."			"Diseases of the Nervous System," *exclusive of Convulsions.*		
	Males.	Females.	Total.	Males.	Females.	Total.	Males.	Females.	Total.
	1.	2.	3.	4.	5.	6.	7.	8.	9.
1881,	1,784	1,460	3,244	4,684	3,819	8,503	2,900	2,359	5,259
1882,	1,748	1,499	3,247	4,412	3,898	8,310	2,664	2,399	5,063
1883,	1,823	1,417	3,240	4,654	3,955	8,609	2,831	2,538	5,369
1884,	1,691	1,286	2,977	4,490	3,721	8,211	2,799	2,435	5,234
1885,	1,692	1,417	3,109	4,614	4,039	8,653	2,922	2,622	5,544
1886,	1,775	1,416	3,191	4,690	4,036	8,726	2,915	2,620	5,535
1887,	1,737	1,430	3,167	4,601	3,979	8,580	2,864	2,549	5,413
1888,	1,625	1,283	2,908	4,414	3,862	8,276	2,789	2,579	5,368
1889,	1,556	1,270	2,826	4,206	3,812	8,018	2,650	2,542	5,192
1890,	1,415	1,166	2,581	4,007	3,621	7,628	2,592	2,455	5,047
	16,846	13,644	30,490	44,772	38,742	83,514	27,926	25,098	53,024

In columns 1, 2, and 3 of the Table the number of deaths from convulsions is given, by which it is seen that deaths ascribed to this cause have shown a decided

tendency to decrease during the decade. This tendency is still more marked if the figures are compared with those for the preceding decade. The total deaths ascribed to convulsions during the decade 1871–80 numbered 38,810, or an average of 3,881 per annum, with a distinct tendency to diminution during that period. For the decade now under consideration the total number was 30,490, or an annual average of 3,049, being decidedly less. For the year 1871 the number was 4,100, for 1881 it was 3,244, and for 1890 2,581 only, a diminution altogether out of proportion to the diminished population. As in many cases of nervous and some other forms of disease convulsions are merely the final condition of some serious organic disease, but being the only condition observed prior to death, the cause of death comes to be recorded as convulsions, often without a medical certificate, therefore greater care in diagnosis and more constant medical attendance during illness would tend to diminish the record of deaths from convulsions, and increase that from other forms of disease where convulsions are a frequent termination.

The deaths from "Diseases of the nervous system, exclusive of convulsions," given in columns 7, 8, and 9, show a distinct increase when the later is compared with the earlier decade, having risen from 46,688 for the decade 1871–80 to 53,024 for the late decade. It will be observed that the middle years of the decade show higher numbers than those at either the beginning or end of the period. The general increase for the later as compared with the earlier decade may be partially explained by the more accurate definition of cases which would formerly have been ascribed to convulsions, but there can be little doubt that a considerable increase in the number is due to a *bona-fide* increase of diseases of the nervous system, which tends to confirm the generally received opinion that there has been an increase of insanity in proportion to the population. In fact the deaths referred to in columns 7, 8, and 9 may be considered to indicate some measure of the prevalence of insanity. If these are further examined by the light of the Abstract (pages 90 and 91), it is seen that nearly all the deaths from brain disease occurred in middle and advanced life.

If the number of deaths under some of the principal headings, are compared with the corresponding figures for the previous decade, very serious increases are noticed; thus, the number of deaths from inflammation of the brain and its membranes rose from 6,249 to 8,617; apoplexy, from 9,944 to 11,002; paralysis of various kinds, including those deaths returned as paralysis, hemiplegia, and paraplegia, from 15,547 to 17,299; insanity, from 2,322 to 3,217; and epilepsy, from 3,453 to 3,524. The miscellaneous group under the head of "Brain Disease, &c.," for the decade of 1871–80, and under the head "Other Diseases of the Nervous System" for the following ten years showed a decrease from 9,122 to 6,410. This decrease is partly owing to more accurate recording and classifying of this class of disease; it, however, does not counterbalance the very serious increases under the other heads. All these serious advances in the prevalence and fatality of nervous affections confirm the opinion so generally prevalent that there is a decided and lamentable increase of insanity in Ireland.

In the case of convulsions nearly all the deaths are among young children. Of the 30,490 deaths ascribed to convulsions 29,313 or 96·1 per cent. were of children under five years of age, or at the average annual rate of 56·0 per 10,000 of the mean population at these ages. There were no less than 23,727 or 77·8 per cent. of all the deaths from convulsions in children under one year of age being equal to 206·2 per 10,000 children born. A large number of these deaths from convulsions are uncertified and were in large towns. There can be no doubt that in many of these cases the attack of convulsions in which the child expires is more a symptom or result of a disease than a disease itself. Thus in many instances infants exposed to the contagion of scarlatina, measles, or some other form of infective fever of a malignant type, are attacked by convulsions and die before the specific characters of the fever have been developed, and in all such cases convulsions must be considered as a secondary not a primary cause of death. Infantile convulsions are also due in many cases to the irritation of teething, to worms or other forms of gastric and intestinal irritation. Convulsions are no doubt promoted by the unhealthy conditions under which the children of the poor live, by the want of proper food and sufficient fresh air and by other unsanitary conditions. The deaths from convulsions in adults are in many cases secondary to kidney, heart, or brain disease, the exact nature of which has not been ascertained.

It is impossible to make a fair comparison between the influence of town and country life in promoting diseases of the brain and nervous system, as many of these cases end their days in asylums, which, though often situated in towns, yet receive large numbers of their patients from widespread rural districts.

Diseases of the Circulatory System caused 50,800 deaths during the decade; 26,101

were males and 24,699 females. If these cases are analysed it is found that 6,391 were ascribed to endocarditis (valvular disease) 470 to pericarditis (or inflammation of the heart's covering), 459 to angina pectoris, 1,773 to syncope, 804 to aneurism, 1,256 to senile gangrene, and 39,647, or at the annual rate of 8·0 per 10,000, to other forms of heart disease. A reference to the Abstract (pages 90 and 91), will show that but few of these deaths occurred in childhood or early adult life, and that the liability to death from heart disease steadily increases as life advances. Many of these cases which occur in middle life have had their origin in the cardiac complications of acute rheumatism or rheumatic fever. At the more advanced ages diseases of the heart arise as secondary complications of diseases of the respiratory organs, and also in consequence of the natural decay which the heart shares in common with the other organs of the body. The deaths from aneurism were 804, of which 588 or 73·1 per cent. were males and 216 or 26·9 per cent. females, the proportion of male to female deaths being much greater in this (the only fatal diseases of arteries) than in diseases of the heart. This difference is attributable to several causes, which, however, it would be out of place here to discuss.

Diseases of the Respiratory Organs caused 153,279 (79,591 males and 73,688 females) deaths during the decade or at the annual rate of 31·0 per 10,000 of the mean population as compared with 142,991, exclusive of those from croup which numbered 14,256 (74,554 males and 68,437 females), or at the rate of 27·0 per 10,000 for the previous decade. The relations between diseases of the respiratory organs and consumption have already been discussed under the head of consumption and in the same place the distribution of these deaths among town and country districts and the aspect of the localities in which they occurred have been dealt with.

In the Abstracts the diseases of the respiratory organs have been grouped under eight heads to which are ascribed the number of deaths stated after each, namely, laryngitis, 1,129 ; croup 9,035 (formerly classified under miasmatic (zymotic) diseases) ; other diseases of the larynx and trachea, 30 ; bronchitis, 101,911 ; pleurisy, 2,385 ; pneumonia, 27,576 ; asthma, 3,281, lung disease unspecified, &c., 7,932.

Table XVI. shows that the rate of mortality from diseases of the respiratory organs was much greater in some years than in others.

As has already been pointed out the deaths from croup were included under the head miasmatic diseases for the decade 1871–80, and are now classified with diseases of the respiratory organs. If the 14,256 deaths from croup registered during the decade 1871-80 were added to the other deaths then classified as diseases of the respiratory organs, the total would be 157,247, which exceeds the total for the later decade by 3,968 deaths from this group of causes, thus showing a decrease instead of an increase in deaths from diseases of the respiratory organs in the later as compared with the earlier decade, but still leaving the rate for the former at 29·7 per 10,000, as compared with 31·0 for the latter. The increase in mortality from pneumonia or inflammation of the lungs appears to be the most remarkable feature in this group of statistics; inflammation of the lungs caused 27,576 deaths as compared with 19,718, or an increase of 7,858, which alone would account for the whole increase in the death rate from diseases of the respiratory organs. There has been a decided decrease in the number of deaths from asthma and bronchitis, and, as already shown, a decrease in croup; the number of deaths from other forms of disease of the respiratory organs remains much the same. As diseases of the respiratory organs (and phthisis) constitute a large proportion of the total deaths, it frequently arises that a high death-rate for a particular year is also accompanied by a high rate of mortality from this group of diseases. Thus the year 1883 had the highest death-rate of the decade, 19·2 (Table XIX.), and we find in that year the deaths from diseases of the respiratory organs were the second highest of the decade, and numbered 16,867. Again in 1885 the second highest death-rate, 18·4, was reached, and in it we find the third highest number of deaths from diseases of the respiratory organs, namely, 16,000 ; however, in 1881, when the annual death-rate was only 17·5 the deaths from diseases of the respiratory organs numbered 16,936, being the highest during the ten years. And, again, the lowest death-rate but one during the period was in the year 1889 when the rate was 17·5 (the lowest being 17·3 in 1882), and in this year the deaths from diseases of the respiratory organs numbered only 13,545.

The average number of deaths per annum from these causes during the decade was 15,328. In 1881 the number reached 16,936, being 1,608 or 10·5 per cent. above the average, while in 1889 the number only reached 13,545, which is 1,783 below the average, the variation between the highest and lowest being 3,391, or 25 per cent. of the latter. Table XIX. shows the maximum, minimum, and mean temperature of the

air, and the yearly rainfall in Dublin, compared with the total death-rate in Ireland, for each of the several years during the decade, and in Table XX. is shown the mean temperature for each month during the decade, for reference in connexion with the same subject.

It will be observed by reference to Table XVI. that in 1881 the deaths from diseases of the respiratory organs registered were more numerous than in any of the other years of the decade. Column 3, of Table XIX., shows that the minimum temperature of the air was lower in that than in any other year during the decade except the following year, 1882, and also that the mean temperature of the year was below the average.

It is well known that a sudden fall of temperature or a long continued low temperature is especially productive of diseases of the respiratory organs, and causes these affections to be particularly fatal to the very young and the very old.

TABLE XIX.—EXTREME TEMPERATURE of the AIR, and MEAN TEMPERATURES deducted from them, and Rainfall in the City of DUBLIN for the Ten years 1881–90, with the DEATH-RATE in IRELAND for each of these years.

With reference to the relation between the fatality from diseases of the respiratory organs and the state of the temperature of the atmosphere a good example is found by the year 1881, when the deaths from these diseases were more numerous than in any other year of the decade, that there was a very cold January and February, which undoubtedly contributed to that result; the unusual death-rate above the average being found in the first quarter of that year. It is this effect of the deaths from the diseases of the respiratory system raising the total death-rate that accounts for the usual rule that severe especially very intense or very prolonged cold is characterised by a high death-rate. It is not only in the case of diseases properly called those of the respira-

tory system—pure and simple—but also in the case of respiratory complications of other forms of disease, especially zymotic diseases, that this severe effect of cold weather is demonstrated. As already pointed out, bronchitis, is by far the most destructive of the diseases of the respiratory system, and it, too, is the most common form of pulmonary complication of other acute diseases, and it is the one above all others, promoted by sudden depression of temperature, or by long-continued cold weather.

Diseases of the Digestive Organs caused 46,776 deaths (24,404 males and 22,372 females), being equal to an annual rate of 9·5 per 10,000 of the mean population. This group includes a large number of diseases, but, unfortunately for statistical purposes, the returns are not of as definite a character as could be desired. Many cases are uncertified, and in many others the medical certificates are, from several reasons, necessarily of an indefinite character. Many of the diseases are of a sub-acute or chronic nature and the medical attendant finds a history difficult to obtain. In other cases the exact nature of the affection is so obscure that without a *post-mortem* examination the medical attendant finds it impossible to certify in more than general terms. It therefore follows that comparatively little advantage would be obtained by a lengthy analysis of the causes of death in this group. Of the 46,776 deaths from diseases of the digestive organs, 3,052 were ascribed to dentition, 7,729 to diseases of stomach, 4,616 to enteritis or inflammation of the bowels, 3,819 to peritonitis, or inflammation of the membrane covering the bowels and other abdominal organs, 1,330 to ascites or dropsy of the abdomen (belly), 2,350 to ulceration of the intestines (bowels), 1,475 to hernia or "rupture," 4,086 to ileus, 509 to intussusception, 510 to stricture of the intestines, 96 to fistula, 2,218 to cirrhosis of liver, and 10,099 to various other forms of disease of the liver. It is right here to point out that several of these diseases are closely associated with one another. Thus, there are deaths ascribed to enteritis, ulceration of the intestines, and peritonitis, making in all 10,785 deaths; generally speaking, ulceration of the intestines is preceded by enteritis, and in a great number of cases peritonitis is the result of ulceration of the intestines, so that we have enteritis followed by ulceration, followed by peritonitis, and the enteritis itself in many cases was owing to enteric fever, or some closely allied cause, in which medical advice had not been obtained in sufficient time to enable the case to be properly dealt with by the physician. It is highly probable that a large number of these 10,785 deaths were the result of neglected enteric fever. Again, there are 1,330 deaths ascribed to ascites or dropsy of the abdomen, which form of dropsy is generally caused by disease of the liver. The various forms of liver disease contribute 13,770 deaths or 29·4 per cent. of all deaths from diseases of the organs connected with the promotion of digestion. Again, there are 7,729 deaths ascribed to diseases of stomach, which is equal to 16·5 per cent. of the total deaths in this order of disease. The other deaths from diseases of the digestive organs do not appear to call for particular comment. Many of the deaths in this order are, no doubt, owing to local development of constitutional disease, such as scrofula, tuberculosis, or cancer, and many, especially among those from "diseases of stomach," and some forms of liver disease, are no doubt due to chronic alcoholism.

Diseases of the Urinary Organs caused 15,156 deaths; of these 10,769 or 71·1 per cent. were males and 4,387 females. These deaths comprise 1,472 from nephritis or inflammation of the kidneys, 5,510 from Bright's disease, which may be considered as chronic forms of kidney disease; 164 from calculus or stone in the bladder. There are also 4,320 deaths from diseases of bladder and of prostate, and 2,796 from "other diseases of the urinary system"; the great bulk of the latter are due to various forms of Bright's disease, of which there are many.

When these various forms of disease are considered with reference to sexes: we find that the number of deaths of males exceeds that of females in every case, and that this preponderance is in a measure due to intemperance as a fruitful cause of kidney disease, and, therefore, this disease is more likely to affect men than women. Owing to the alteration in the classification of deaths the various forms of diseases of this class cannot be compared with the preceding decade to any considerable extent. The Abstract (pages 92 and 93), shows that all forms of disease of the urinary organs are comparatively rare in early life and increase considerably after the age of 20.

Diseases of the Organs of Generation caused 1,712 deaths, of which 1,654 were females and only 58 males: these deaths are nearly all attributable to diseases of the uterus and ovaries of females in advanced life and do not call for special remarks.

Diseases of the Organs of Locomotion caused 2,684 deaths during the decade: many of them were due either to diseases established as the result of accidents or to local results of scrofulous disease.

Diseases of the Integumentary System are seldom fatal and when so are of a rare and unusual character, and scarcely call for any remark in this place; 2,505 deaths were ascribed to these diseases.

IV.—DEVELOPMENTAL DISEASES.

This class caused 181,438 deaths (82,486 males and 98,952 females), or 20·5 per cent. of the entire number of deaths.

In the preceding decade, deaths from teething and childbirth were included in this class; the former is now known as dentition, and belongs to the digestive order, and childbirth to the reproductive system, the latter having been already sufficiently discussed in connection with the subject of puerperal fever. But in both decades we can contrast the deaths from premature birth and old age. In the ten years, 1871-80 there resulted 2,302 fatal cases from premature birth, and in 1881--90 the number was 3,301, or 999 of an increase. To what cause this increase is due it is impossible to say, but probably, and this applies to both decades, many cases of premature birth might have been avoided if the mothers had been living under healthy circumstances, or had been free from disease or accident.

To the natural decay of old age, there were attributed 177,225 deaths (80,185 males and 97,040 females); in the earlier decade, the males and females together amounted to 206,349. Many of the deaths assigned to old age might, no doubt, have been more accurately described, but at such advanced ages as the great bulk of these persons were at the time of death, illnesses which at earlier ages would be insignificant, readily prove fatal. Atrophy and debility formed an order of developmental disease in the previous decade, and caused 50,738 deaths, but are now included in the class of "ill-defined and not specified causes," and described as "debility," "atrophy," "inanition." The deaths from them amount to 53,988 (26,251 males and 27,737 females), a large proportion (56·2 per cent.) being of children under one year old.

V.—DEATHS FROM VIOLENCE.

Deaths from violence do not form an important class in a country like Ireland, where manufacturing industry constitutes but a small portion of the occupation of the people, and where mining operations are carried on to but a limited extent.

The deaths from violence numbered 18,983 during the decade, or at the average annual rate of 3·9 per 10,000 of the mean population. As might be anticipated, the death-rate from violence is higher, namely, 5·2 per 10,000, in town than it is in country districts, where it reaches a rate of 3·3 only. It is, however, a remarkable fact that the deaths from violence do not bear as high a proportion to the population in the great manufacturing town of Belfast, where the rate is 5·0, as in the Dublin districts, where the rates are 7·2 and 6·2 for north and south respectively, or in Cork, where the rate is 5·3. In the smaller towns the numbers are not sufficiently large to enable us to draw conclusions, for in these any single catastrophe causing the loss of several lives might seriously raise the death-rate from violence. The general distribution of violent deaths throughout Ireland does not call for any special remark.

The following statement shows the distribution of the various order of deaths from violence between the sexes:—

	Males.	Females.	Total.
Accident or Negligence,	11,542	5,133	16,675
Homicide,	729	421	1,150
Suicide,	832	294	1,126
Execution,	32	—	32
Total,	13,135	5,848	18,983

From this it appears that the deaths from violence among males were more than double the number among females, the former being equal to 69·2 per cent., and the latter equal to 30·8 per cent. of the total deaths from violence. This excess of male over female deaths exists throughout all the four orders of this class. If, however, the deaths in each sex are compared at different ages, as shown in the Abstract (pages 94 and 95), it will be observed that among children the excess of male over female deaths from violence is not great, whereas at the more active periods of life it is much greater than the proportion shown in the above statement. Thus, in children under one year of age, there were among the males 686 deaths from accident or negligence, and among the females 511. Under five years there were from the same cause 2,112 deaths

among males, and 1,609 among females, making a total of 3,721 deaths from accident or negligence among young children. It may be pretty confidently stated that nearly all these deaths may be more correctly ascribed to negligence than to accident, as will be pointed out further on, with special reference to the question of burns and scalds. During the more active periods of life, when exposure to accident is greatest, the number of deaths in males is 5,173, and in females only 1,347 or about one-fourth. If the modes of death by violence are more closely analysed it will be found that the three principal causes were fractures and contusions, burns or scalds, and drowning.

Fractures and contusions caused 6,755 deaths, of which 5,055 were males and 1,700 females. The great bulk of these occurred in middle or advanced life, comparatively few being among young children. It is remarkable the increasing mortality from this cause at such advanced ages. This is not that old persons are more liable to accidents, but that when accidents do occur to old people they are much more likely to be followed by fatal results.

The very large number of deaths from burns (including scalds) is remarkable: these constitute 3,709 (1,729 males and 1,980 females), or 19·5 per cent. of all the deaths from violence. The most prominent feature in this large mortality from burning is that of these 3,709 deaths, no less than 2,016 or 54 per cent. were in children under five years of age, and must, therefore, have been owing to the carelessness or neglect of the parents or other guardians of these helpless little ones. The suffering indicated by these figures must have been of a very terrible character. In addition to these deaths among very small children there were 443 (189 males and 254 females) of children from five to ten years of age. Among young adults and the middle aged—namely, from ten to forty-five years of age, the deaths were only 385 (149 males and 236 females). In advanced life from forty-five upwards the deaths were 865 (294 males and 571 females); in persons who were upwards of seventy-five years of age, and had to a great extent become helpless from age, in fact who had reached their second childhood, the number was no less than 295 (105 males and 190 females). With reference to sex it will be observed that of the whole 3,709 deaths from burning, 1,729 were males and 1,980 females, or 46·6 and 53·4 per cent. respectively, the number of female deaths being in excess of the males. This is almost certainly owing to the fact that a large number of these deaths are caused by the clothes accidentally taking fire, and this view is supported by the fact that the number of deaths from burning among males under five years of age is greater than the number of females—namely, 1,097 males and 919 females. At this period of life there is but little difference in the method of clothing the two sexes; at the ages of five to ten when the female garments become of a more inflammable description the deaths were 189 for males and 254 for females, showing a larger number for females, and this proportion is found to prevail pretty constantly through all the remaining age periods. In fact, adult females, owing to the nature of their clothing, have about double the chance of being burnt to death that males have.

Drowning caused 3,524 deaths, of which 2,882 were males and 642 females. As shown in the Abstract (pages 94 and 95) the greater number of these deaths occurred in males at the active periods of life.

The other causes of deaths by accident or negligence do not call for any specific notice.

Homicidal deaths numbered 1,150, of which 729 were males and 421 females: of these 525 (252 males and 273 females) were infants under one year and may be classed as infanticides, the balance, 625, of the total may be classed as murder or manslaughter. In connexion with this branch of the subject it may be mentioned that there were 32 persons (all males) executed in Ireland during the 10 years.

Deaths from suicide numbered 1,126—832 males and 294 females: nearly all were in persons over 20 years of age. The modes of death by suicide do not seem to call for any special remarks.

In the preceding decade 18,373 deaths were ascribed to accident or negligence, 905 to homicide, 958 to suicide, and 15 (all males) were executed.

AGES.

The deaths of infants under one year of age numbered 108,855, being at the rate of 95 per 1,000 births registered.

Amongst children under five years of age there occurred 188,332 deaths, a mortality equal to an average annual rate of 36·0 per 1,000 of the living at that age. Of these 188,332 children, 100,482 were boys, and 87,850 girls: the death rate among boys being 37·8 per 1,000 living, and that for girls 34·1 per 1,000.

The average annual number of deaths of persons aged sixty-five years and upwards is equivalent to 9·7 per cent. of the mean number of the living at that age.

Amongst the 883,156 deaths registered during the ten years are 6,462 of persons stated to have been aged ninety-five years and upwards—2,927 males and 3,535 females.

The following statement gives a summary of the death-rates of the population of Ireland at each age period :—

TABLE XXI.—AVERAGE ANNUAL Number of DEATHS of Males and of Females in IRELAND at each of TWELVE AGE PERIODS to every 10,000 LIVING at the same Ages.

SEX.	AGE PERIODS—Mortality per 10,000 Living.												
	ALL AGES.	Under 5 years.	5–	10–	15–	20–	25–	35–	45–	55–	65–	75–	85 and upwards.
Males,	180·5	378·2	49·3	32·0	52·1	77·6	90·5	103·3	154·9	287·9	640·4	1349·6	2824·6
Females,	177·2	340·9	53·7	41·9	61·9	72·4	90·9	102·9	142·6	284·7	649·5	1329·0	2697·6
Total,	178·8	359·8	51·5	36·8	57·1	75·0	90·7	103·1	148·5	286·2	645·0	1339·2	2758·7

From this it appears that among male children under five years of age the average annual death-rate was 378·2 per 10,000, while the corresponding rate for female children was but 340·9 per 10,000; for each of the next three quinquennial age periods the female death-rate exceeded the male rate thus:—the rate among boys aged five and under ten was 49·3 per 10,000, and that for the girls 53·7 per 10,000; among boys aged ten years and under fifteen the rate was 32·0, and among girls it was 41·9, and the deaths of males aged fifteen and under twenty were equal to 52·1 per 10,000, while those of females of that age equalled 61·9 per 10,000. In each of the remaining age periods (except 25–35 and 65–75) the male death-rate was in excess of the female; for the period twenty and under twenty-five the respective rates were 77·6 (males), and 72·4 (females); for the period twenty five and under thirty-five, they were 90·5 and 90·9; for thirty-five and under forty-five they were 103·3 and 102·9; for the next decennial period, 154·9 and 142·6; for fifty-five and under sixty-five they were 287·9 and 284·7; for sixty-five and under seventy-five 640·4 and 649·5; for the next ten-year period 1,349·6 and 1,329·0; and amongst persons aged eighty-five years and upwards 2,824·6 and 2,697·6.

The following is a supplement to the foregoing summary of deaths by ages, showing the per-centage of the total deaths which occurred during each age period :—

TABLE XXII.—PROPORTION PER CENT. of the DEATHS at ALL AGES in the Ten Years 1881–90, which occurred at EACH OF TWELVE AGE PERIODS.

SEX.	AGE-PERIODS.—Proportion per cent. of the Deaths at All Ages which occurred at EACH PERIOD.												
	ALL AGES.	Under 5 years.	5–	10–	15–	20–	25–	35–	45–	55–	65–	75–	85 and upwards.
Males,	100·0	23·0	3·2	2·2	3·3	4·0	6·0	5·8	7·6	11·0	14·5	14·1	5·3
Females,	100·0	19·7	3·4	2·7	3·9	3·8	6·6	6·4	7·5	11·6	15·1	13·9	5·4
Total,	100·0	21·4	3·3	2·4	3·6	3·9	6·3	6·1	7·6	11·3	14·8	14·0	5·3

From this it appears that 23·0 per cent. of the deaths of males and 19·7 per cent. of those of females occurred amongst children under five years of age. The deaths of males aged five and under twenty-five years formed 12·7 per cent. of the total number of deaths of males, and those of females of that age 13·8 per cent of the total female mortality; 11·8 per cent. of the deaths of males and 13·0 per cent. of those of females occurred among persons aged twenty-five and under forty-five; 18·6 per cent. of the male mortality was amongst men aged forty-five and under sixty-five, and 19·1 per cent. of the female mortality amongst women of those ages; and 33·9 per cent. of the deaths of males and 34·4 per cent. of those of females occurred among persons aged sixty-five years and upwards.

EMIGRATION.

According to the Returns obtained by the Royal Irish Constabulary and the Metropolitan Police, who acted as enumerators at the several Irish seaports, the number of emigrants who left Ireland during the ten years 1881–90 amounted to 770,706 ; of these 395,298 were males and 375,408 were females. In the previous decade 623,933 persons emigrated. Of the whole number in the late decade, 138,662 were from Leinster ; 251,539 from Munster ; 218,645 from Ulster ; and 161,860 from Connaught.

Of the total emigrants from Ireland in the ten years, 13·7 per cent. were under fifteen years of age at the time of their departure ; 75·9 per cent. were between fifteen and thirty-five years old ; and 10·4 per cent. were thirty-five or upwards.

PRICES OF PROVISIONS, AND PAUPERISM.

The subjoined Table shows for each of the ten years, 1881–90, the average prices of provisions in Dublin, and the average number of persons in Ireland receiving indoor or out-door relief on Saturdays.

The mean price of oatmeal (1st quality) for the ten years was 15*s.* 7*d.*, the yearly average prices ranging from 13*s.* 7*d.* in 1889 to 17*s.* 6*d.* in 1884 and 1885 ; the mean prices of potatoes were from 2*s.* 8*d.* to 3*s.* 7*d.*, the lowest average prices for any year being from 2*s.* 2*d.* to 2*s.* 9*d.* in 1888, and the highest 3*s.* 9*d.* to 4*s.* 10*d.* in 1883 ; beef was lowest in 1887, the average prices being from 44*s.* to 53*s.* 6*d.*, and highest in 1883, the average prices being from 66*s.* 6*d.* to 77*s.* ; the mean prices for the ten years were from 54*s.* 6*d.* to 65*s.* 6*d.*

The mean number of workhouse inmates in Ireland on Saturdays during the ten years (derived from returns furnished by the Local Government Board) was 47,582, and the mean number of persons receiving out-door relief was 62,860. The lowest average number of workhouse inmates for any one year was 43,009 in 1890, and the highest 53,038 in 1881, and the average numbers on out-door relief ranged from 57,969 in 1884 to 77,456 in 1886.

TABLE XXIII.—AVERAGE PRICES in DUBLIN of BREAD, OATMEAL, POTATOES, and BEEF, during the years 1881-90, and the AVERAGE NUMBER of PERSONS in IRELAND receiving IN-DOOR and OUT-DOOR RELIEF on Saturdays in those years.

YEAR.	*Average* PRICES OF PROVISIONS.				PAUPERISM. *Average* NUMBER OF PERSONS RELIEVED.†	
	BREAD (4-lb. Loaf).*	OATMEAL (Corn Exchange), per Cwt. (1st quality).	POTATOES (at Potato Market), per Cwt.	BEEF (at the Dublin Cattle Market), per Cwt.	In-door.	Out-door.
	d.	*s. d.*	*s. d.* to *s. d.*	*s. d.* to *s. d.*

* Prices for years 1881–7, and the first two quarters of 1888, were derived from Returns furnished by Messrs. Manders and Co., those for the third and fourth quarters of 1888, and for the years 1889 and 1890, from Returns received from "Bolands, Limited," and Messrs. Johnston and Co. (or Johnston, Mooney, and O'Brien, Limited)—the prices quoted for these two firms including delivery.

† Compiled from Returns furnished by the Local Government Board.

THE WEATHER.

The following particulars have been extracted from Returns of Meteorological Observations taken during the years 1881–90, inclusive, at 40, Fitzwilliam-square, West, Dublin, by J. W. Moore, M.D., Univ. Dub., F.R.C.P.I., F.R. Met. Soc., Observer at Dublin for the Meteorological Office, London :—

The Average‡ Mean Atmospheric Pressure has been obtained from daily readings of the barometer at 9 A.M. and 9 P.M., corrected and reduced to 32° Fahrenheit at the mean sea level. The Average Mean Temperature of the Air given in the Tables is the arithmetical mean of the readings of the Dry Bulb Thermometer in a Stevenson stand taken daily at 9 A.M. and 9 P.M. In a separate Table, the Average Mean Temperature values have been deduced from the maximal and minimal readings

‡ Throughout this Abstract the term "Average" is employed to denote *the arithmetical mean of a series of means* ; thus, by Average Atmospheric Pressure we understand the arithmetical mean of a series of ten years' annual mean pressures.

of the thermometer in the shade by an empirical Formula, viz., *min.* + {*max.–min.* × C.} = *Mean Temperature.* The co-efficient C. is a variable quantity from month to month which has been determined by a careful comparison of the arithmetical means of the maximum and minimum thermometer readings with the results yielded by the tracings taken by the thermograph at self-recording observatories of the First Order. The co-efficients for the different months are—January and December, ·520; February and November, ·500; March and October, ·485; April and September, ·476; May and August, ·470; June and July, ·465. The Tension of Aqueous Vapour (expressed in terms of inches of mercury), Relative Humidity, and Amount of Cloud, are the result of observations taken daily at 9 A.M. and 9 P.M. The Rainfall is that measured at 9 A.M. each day and entered to the preceding day. A *Rainy Day* is one on which at least five-thousandths (·005) of an inch of rain falls within the twenty-four hours from 9 A.M. to 9 P.M. The number of days of rain, snow, hail, thunderstorms, clear sky, over-cast sky, and gales are calculated from observations at 9 A.M. and 9 P.M., and the same applies to the results obtained as to the Direction of the Wind.

The *Average Mean Height of the Barometer* during the ten years 1881-90, was 29·929 inches. The annual mean varied from 29·881 inches in 1882 to 30·015 in 18, a difference of somewhat more than an eighth of an inch (·134 inch.)

The monthly average ranged from 29·839 inches in November to 30·010 inches in June. The extreme monthly means were—highest, 30·256 inches in February, 1887; lowest, 29·543 in February, 1885. The absolute extreme readings of the Barometer were—maximum, 30·935 inches at 10·30 P.M., of January 18, 1882; minimum, 27·758 inches, at 2·30 P.M., of December 8, 1886.

The extreme range of atmospherical pressure was, therefore, 3·177 inches.

The *Average Mean Temperature* deduced from observations at 9 A.M. and 9 P.M. was 48·9°, the average at 9 A.M. being 49·3°, and that at 9 P.M. 48·5°. The annual mean varied from 48·2° in 1885 to 50·2° in 1884—a range of 2°. The monthly average varied from 41·2° in January to 59·4° in July—an annual range of 18·2°. The extreme monthly means were—highest, 63·4° in July, 1887; lowest, 32·8° in January, 1881—a range of 30·6°. The absolute extremes of temperate were—highest, 78·9° on August 8, 1887; lowest, 13·3° on December 14 and 15, 1882. These values give a range of 65·6° in the screen. The average temperature for the ten years deduced from the observed daily extremes was 49·3°.

Rain fell on 1,961 days, including snow or sleet on 223 days, and hail on 313 days. The average annual number of rainy days was therefore 196·1, of snowy days 22·3, and of days of hail 31·3. The total rainfall measured 267·729 inches. The smallest annual fall was 16·601 on 160 days in 1887; the largest fall was 32·966 inches on 220 days in 1886. The average annual fall appears as 26·773 inches. The ten years' monthly fall varied from 16·356 inches on 144 days in June to 29·283 inches on 190 days in November.

The maximal rainfall in twenty-four hours was 1·942 inches, on August 19, 1889, a downpour which was nearly approached on October 15, 1886, when 1·560 inches were measured. June and July were the only months in the year in which no rainfall of one inch in twenty-four hours took place; the heaviest downpour in these months was ·951 inch on June 27, 1888, and ·624 inch July 22, 1889. The distribution of rain was as follows:—for the first quarter, 63·348 inches; for the second, 58·204; total for the first half year, 121·552 inches. In the third quarter 69·591 inches, and in the fourth quarter 76·586 inches fell. Total for the second half year, 146·177 inches, or only about one-fifth as much again as the rainfall of the first six months. The numbers representing rainy days for the first, third, and fourth quarters are 499, 485 and 527 respectively. In the second quarter the rainy days were much fewer, namely 450. From these figures we conclude that the second quarter is the driest, though the rain is heavier than in the first and fourth quarters. The heaviest rain occurs in the third quarter. If 127 will represent the heaviness of the rain in the first quarter, 129 will represent that in the second, 143 that in the third, and 126 that in the fourth. The rainfall in the fourth quarter, though not heavy, is distributed over a greater number of days.

Of the 223 snowy days, 154 were found in the first quarter, 21 in the second, none in the third, and 48 in the fourth. Of the 313 days on which hail was observed, 141 fell in the first quarter, 83 in the second, 17 in the third, and 72 in the fourth.

As regards the *Direction of the Wind,* 7,309 observations were made, with this result:—N., 476; N.E., 499; E., 680; S.E., 600; S., 714; S.W., 1,087; W., 1,948; N.W., 872; calm, 428. The preponderance of westerly (S.W. to N.W.) over easterly (N.E. to S.E.) winds is very strikin—theg figures are 3,907 and 1,779 respectively, more than 2 to 1 in favour of westerly winds. But the great excess of W. winds is still more remarkable. They number 1,948, or nearly double the number of S.W. winds, 1,087. Partial deflection of S.W. winds by a range of mountains—with summits of 2,000 feet and upwards—to the southward of the city in some measure accounts for this, and a further explanation is to be found in the frequent occurrence of light westerly land breezes during calm cold weather in winter, spring, and autumn. Correlated to this class of westerly winds are the light easterly and south-easterly breezes of the day time, which so materially modify the heats of summer in Dublin, and go so far to swell the number of E. and S.E. winds included in the Table.

Gales were recorded on 274 occasions, of which 112, or considerably more than one-third, happened within the first quarter, only 28 in the second, 37 in the third, and 97 in the fourth. January, with 44 gales, was the stormiest month. There were only three gales in June.

Thunderstorms occurred on 74 days, of which 4 were in the first quarter, 25 in the second, 36 in the third, and 9 in the fourth. June (with 12 storms) and July (with 19) were the months in which electrical disturbances most frequently took place. Only one thunderstorm happened in December, and not even one in January. On 375 occasions the sky was clear, or the amount of cloud was under 20 per cent.; on 1,006 occasions it was overcast, that is, the amount of cloud exceeded 80 per cent. The first quarter was the cloudiest (326 overcast skies), the fourth quarter was the clearest (115 clear skies).

The *Amount of Cloud* varied from 65 per cent. at 9 A.M. to 56 per cent. at 9 P.M., the average being 61 per cent.

The following are more detailed remarks upon the weather in the different months:—

JANUARY.—The average height of the barometer was 29·931 inches. It varied from 30·242 inches in 1882 to 29·662 inches in 1886—a range of not less than ·580 inch. The mean pressure, 30·242 inches, observed in 1882, is the highest monthly mean recorded during the ten years, with the exception of February, 1887, when it was 30·256 inches. The average mean temperature was 41·2°. In 1884 the mean dry bulb temperature was 45·2, in 1881 it was 32·8°. The absolute extreme temperatures were—highest 58·8°, on the 9th, in 1888: lowest, 15·2°, on the 25th, in 1887. The average rainfall was 2·099 inches on 18·0 days: the extremes of rainfall were—maximum, 3·244 inches on 26 days, in 1886; minimum, 1·247 inch, on 9 days, in 1888. The absolute maximal fall in 24 hours was 1·221 inches, on the 11th, in 1889. Snow or sleet fell on 54 and hail on 41 days during the ten years. There were 44 gales. The most prevalent wind was W., which was recorded 206 times out of a total of 620 observations. Next came S. W., with 123 observations. The N.E. and N. winds were the least frequent, with 22 and 17 observations respectively. The average amount of cloud was 64 per cent. 66 at 9 A.M. and 62 at 9 P.M.

FEBRUARY.—The average atmospheric pressure was 29·978 inches, the mean value varying from 30·256 inches in 1887 to 29·543 inches in 1885. The average mean dry bulb temperature was 41·5. It ranged from 45·9 in 1882 to 38·0 in 1888. The absolute extremes of temperature were—highest, 58°·4, on the 26th, in 1885, lowest 21·7°, on the 11th, in 1889. The average rainfall was 2·169 inches on 15·7 days; the extremes of rainfall were—maximum, 3·752 inches, on 17 days, in 1883: minimum, 0·541 inch, on 11 days, in 1887. In 1890 there were only 7 rainy days, but in 1884 and also in 1889 there were 20 days. The absolute greatest fall in twenty-four hours was 1·007 inches, on the 1st, in 1883. Snow or sleet fell on 40 and hail on 36 days within the ten years. There were two thunderstorms. There were 30 gales. The wind blew most frequently from W.—on 146 occasions—least so from N. and N.E.: from each of these points on 26 and 40 occasions respectively. The average amount of cloud was 68 per cent.—71 at 9 A.M. and 63 at 9 P.M.

MARCH.—Average height of the barometer—29·913 inches, the mean ranging from 30·101 inches in 1887 to 29·646 inches in 1888. Average mean dry bulb temperature=42·1°, varying from 46·5° in 1882 to 38·1° in 1883. The absolute extremes of temperature were—highest, 60·6°, on the 7th, in 1882; lowest, 23·0°, on the 4th, in 1886. The average rainfall was 2·066 inches on 16·2 days; the extremes of rainfall were—largest, 3·753 inches on 18 days in 1888; smallest, 1·056 inch on 12 days in 1883. In 1886 there were 19 rainy days. The absolute maximal fall in twenty-four hours was 1·012 inches, on the 11th, in 1888. Snow or sleet fell on 60 days and hail on 64 days during the ten years. There were 2 thunderstorms and 38 gales. The most prevalent wind was once more W., observed on 177 occasions. The least prevalent winds were N.E. (38 observations) and S. (46 observations). The average amount of cloud was 62 per cent.—66 at 9 A.M. and 57 at 9 P.M.

APRIL.—Average height of the barometer—29·882 inches. The mean ranged from 30·051 inches, in 1887, to 29·744 inches in 1882, or only through ·307 inch, being only slightly over half the mean range observed in January (·589 inch). Average mean dry bulb temperature—45·9°, varying from 46·9°, in 1882, and also in 1883, to 44·3°, in 1887. The absolute extremes of temperature were= 66·1°, on the 19th, in 1885, and 28·8°, on the 9th, in 1888. The average rainfall was 2·097 inches on 14·7 days; the extremes being—greatest, 3·526 inches, on 20 days, in 1882; least, 1·329 inch, on 13 days, in 1881. In 1889 there were 21 rainy days, producing 2·607 inches of rain, while for 10 days in 1883, the rainfall measured 2·207 inches. The absolute maximal fall in twenty-four hours was 1·389 inches on the 6th in 1883. Snow or sleet fell on 15 days, hail on 41 days in the ten years. There were 6 thunderstorms and also 11 gales. The E. wind was the most prevalent, being observed on 113 occasions. A S. wind was noted on only 49 occasions. There is a marked increase in the prevalence of easterly and north-easterly (85 observations) winds in this month. The average amount of cloud was 58 per cent.—63 at 9 A.M. and 51 at 9 P.M.

MAY.—The average pressure was 29·936 inches, the mean ranging from 30·092 inches in 1887 to 29·779 inches in 1885. Average mean dry bulb temperature=52·1°, ranging from 54·1° in 1889 to 48·7° in 1885. The absolute extremes of temperature were—highest, 72·5° on the 21st in 1889; lowest, 32·7° on the 7th in 1885. The average rainfall was 2·088 inches on 15·9 days. In 1886 no less than 5·472 inches of rain fell on 21 days; in 1887, on the contrary, the fall amounted to only 0·882 inch on 10 days. In 1885 there were 23 rainy days. The absolute maximal fall in twenty-four hours was 1·387 inches, on the 8th, in 1883. Snow or sleet fell on 6 days, hail on 34 days in the ten years. There were 7 thunderstorms, and 14 gales. W. winds were most frequent, being 117 in number, but were nearly equalled by E. winds which numbered 112. S. winds occurred on 48 occasions; while N., N.E. and N.W. together made up 163 out of 620 observations. The average amount of cloud was 55 per cent., 60 at 9 A.M. and 50 at 9 P.M. The comparative clearness of the sky at 9 P.M. is a striking feature of the meteorology of May.

JUNE.—Average pressure=30·010 inches, the mean varying from 30·213 inches in 1887, to 29·873 inches in 1882. Average mean dry bulb temperature=57·5°, the range being from 62·3° in 1887, to 55·8° in 1882. The absolute extreme temperatures were—maximum, 78·4°, on the 17th, in 1887, minimum, 36·8°, on the 8th, in 1881. The average rainfall was 1·636 inches, on 14·4 days. The monthly fall was 3·045 inches on 18 days in 1888, and only 0·100 inch on 6 days in 1889. In 1882 there were 25 rainy days, and the total fall was 2·384 inches. The absolute maximal fall in twenty-four hours was 0·951 inch on the 27th in 1888. There was no snow or sleet, but hail was noted on 8 days. There were three gales. Thunderstorms occurred on 12 occasions. The wind blew from W. on 129 occasions; from N. on 50. The average amount of cloud was 58 per cent.—64 at 9 A.M., and 52 at 9 P.M.

JULY.—Average height of barometer=29·906 inches. Mean ranging from 30·162 inches in 1885 to 29·747 inches in 1888. Average mean dry bulb temperature=59·4°, varying from 63·4° in 1887 to 56·6° in 1888. The absolute extreme temperatures were—highest, 78·7° on the 3rd in 1886; lowest, 42·9° on the 11th, in 1888. The average rainfall was 2·285 inches on 18·9 days, from which values

the essentially rainy character of this month is demonstrated. The heaviest rainfall was 3·881 inches on 22 days in 1888; the slightest was 1·154 inch on 10 days in 1885. The maximal fall in twenty-four hours was 0·624 inches on the 22nd, in 1889. There were as many as 25 rainy days in each of the years 1882 and 1884 (in 1882, 3·722 inches fell). Neither snow nor sleet occurred. Hail fell on 5 days. There were 19 thunderstorms and 8 gales. The most prevalent wind was W., observed 174 out of 610 times. The least frequent wind was N.E. (26 observations.) Average amount of cloud = 64 per cent.—69 at 9 A.M. and 59 at 9 P.M.

AUGUST.—Average atmospheric pressure=29·929 inches, the mean ranging from 29·992 inches in 1885 to 29·812 inches in 1881. Average mean dry bulb temperature, 58·1°—in 1884, 60·7°; in 1890, 56·3°. The extremes of temperature were—maximum, 78·9° on the 8th in 1887; minimum, 41·2° on the 14th in 1885. The average rainfall was 2·658 inches on 15·0 days, showing this month to be like July, a rainy one. The maximal rainfall was 5·747 inches on 22 days in 1889; the minimal fall was 0·777 inches on 8 days in 1884. Rain was measured on 21 days in 1881, but on only 11 days in 1882. The heaviest rainfall within twenty-four hours was 1·942 inches on the 19th in 1889. This downpour was quite exceptional for Dublin, and was never exceeded in the ten years. There was no snow or sleet. Hail fell on only 7 days. There were 11 thunderstorms and 9 gales. The most frequent wind was W. (168 observations); the least so was S.E. (29 observations.) The average percentage of cloud was 59—that at 9 A.M. was 66, that at 9 P.M. 51.

SEPTEMBER—The average height of the barometer was 29·968 inches, the mean ranging from 30·179 inches in 1888 to 29·811 inches in 1883. The average mean dry bulb temperature was 54·9. In 1890 it was 58·9°; in 1882 it fell to 52·7°. The absolute extreme temperatures were—highest, 73·7° on the 9th in 1884; lowest, 34·4°on the 27th in 1885. The average rainfall was 2·016 inches on 14·6 days. In 1883 the fall amounted to 3·637 inches on only 14 days, but in 1888 it was only 0·728 inches on 10 days. The maximal fall in twenty-four hours was 1·380 inches on the 1st in 1883. There was neither snow nor sleet, and hail fell on only 5 days. There were 6 thunderstorms and 20 gales. The W. wind as usual chiefly prevailed, being noted on 133 occasions. The least frequent wind was E. (37 observations). The average cloudiness was 57 per cent.—62 at 9 A.M. and 51 at 9 P.M.

OCTOBER.—The average barometrical height was 29·933 inches; the annual mean pressure varying from 30·144 inches in 1887 to 29·673 inches in 1889. The average mean dry bulb temperature was 48·6°; in 1886 it was 51·4°; in 1885 it fell to 44·8°. The absolute extremes of temperature were—highest, 66·6° on the 27th, in 1888; lowest, 30·9° on the 16th, in 1881. The average rainfall was 2·709 inches on 17·4 days. In 1886 the rainfall amounted to as much as 6·163 inches on 24 days; in 1889 also 4·853 inches fell on 22 days. The least rainfall in this month was 0·639 inches on 11 days in 1890. The maximal fall in twenty-four hours was 1·560 inches on the 15th, in 1886. Snow or sleet fell on 2 days—once in 1887 and once in 1890. Hail occurred on 19 days, of which 7 were in 1885. There were 5 thunderstorms and 28 gales. The wind blew most frequently from W. (on 172 occasions); least so from S.E. (on only 33 occasions). The average amount of cloud was 59 per cent.—at 9 A.M., 62, and at 9 P.M., 55.

NOVEMBER.—Average height of barometer=29·839 inches, the mean ranging from 30·191 in 1889 to 29·664 inches in 1882. The average mean dry bulb temperature was 45·1°. It rose to 50·0 in 1881, and fell to 42·1° in 1887. The absolute extremes of temperature were—highest, 63·0° on the 19th in 1890; lowest, 26·3° on the 29th in 1890. The average rainfall was 2·928 inches on 19·0 days. The fall ranged from 6·549 inches on 26 days in 1888 to 0·929 inches on 9 days in 1889. In 1890 there were 27 rainy days with 4·212 inches. The fall of 6·549 inches exceeded that of any other month in the ten years, the nearest approach to this downpour being 6·163 inches in October, 1886, and 5·747 inches in August, 1889. The maximal fall in twenty-four hours was 1·519 inches on the 28th, in 1888. Snow or sleet fell on 16 days in the 10 years, and hail on 27 days. There were 3 thunderstorms and 39 gales. The W. wind was, as usual, most prevalent (188 observations out of 600); the N.E. wind was least prevalent (22 observations). The average cloudiness was 62 per cent.; at 9 A.M. 61, and at 9 P.M. 62.

DECEMBER.—The average height of the barometer was 29·920 inches, the mean varying from 30·184 inches in 1885 to 29·641 inches in 1882. This range of the mean pressure, amounting to ·543 inch, exceeds that observed in January, namely, ·527 inch. The average mean temperature was 40·6, lower by 0·6° than that of January, the next coldest month on the average of the 10 years. The anomaly of December being colder than January is explained by the intense cold of December in the years 1882, 1886, and 1890, when their mean temperatures were 37·7°, 37·2°, and 38·9° respectively. In 1883, on the other hand, the mean temperature rose to 42·5°. The absolute extremes of temperature were—maximum, 59·6° on the 3rd and 5th, in 1888; minimum, 13·3° on the 14th and 15th, in 1882. The average rain fall was 2·021 inches on 16·3 days. It varied from 3·782 inches on 21 days in 1882, to 0·742 inch on only 10 days in 1885. The absolute heaviest fall in twenty-four hours was 0·734 inch on the 14th in 1886. Snow or sleet fell on 30 days; hail on 26. One thunderstorm occurred. There were 30 gales. A vast preponderance of W. and S.W. winds was noted—237 observations of W. and 97 of S.W., together giving 334 out of a total of 620 observations, that is considerably more than one-half. In marked contrast, the N.E. wind was observed on only 18 occasions; the N. on only 21. The average quantity of cloud was 61 per cent.—62 at 9 A.M. and 58 at 9 P.M.

I have the honour to be

Your Excellency's faithful servant,

THOS. W. GRIMSHAW,

Registrar-General.

GENERAL REGISTER OFFICE,
CHARLEMONT HOUSE, DUBLIN,
12th December, 1894.

POPULATION OF IRELAND (including Army, Navy, and Merchant Seamen on shore or in port) *estimated* to the middle of each of the seventy-five Years 1816 to 1890, inclusive:—

Middle of the Years.	Estimated Population. Persons.	Males.	Females.	Middle of the Years.	Estimated Population. Persons.	Males.	Females.	Middle of the Years.	Estimated Population. Persons.	Males.	Females.

NOTE.—This Table has been constructed for the years 1816 to 1831—By adopting the rates of increase of the male and female population between 1821 and 1831, as shown by the Irish Census Reports of 1831—the first complete Census of Ireland having been taken in 1821.

1832 to 1841—By adopting the rate of increase between the population of 1831 and 1841 according to the Irish Census Report of 1841.

1842 to 1846—By taking the English average birth-rate of 1 in 31, and death-rate of 1 in 45, and deducting the annual emigration from Ireland according to the returns received from the Emigration Commissioners in England.

1847 to 1851—The English birth-rate, as above, was used, deducting the number of deaths and the number of emigrants in each year, as given in the Irish Census Reports of 1851; an allowance, proportioned to the number of recorded deaths and the number of emigrants being made in each year for the excess of the number thus arrived at for 1851 over the actual population according to the Census of that year.

1852 to 1871—The English birth and death rates, as above, were used, deducting the number of emigrants according to the return obtained by the Registrar-General for Ireland, and allowing for excess over Census numbers for 1861 and 1871 as explained for the last period

1872-90—By adding the Births registered in each year to the estimated population for the previous year, deducting the deaths and emigration, and adjusting the results for the years 1872-81, and 1882-90, to allow for the discrepancy between the number thus arrived at fo 1881 and 1890 respectively, and the estimates based on the Censuses taken in 1881 and 1891.

AGES of the POPULATION in IRELAND according to the Census Returns of 1861, 1871, 1881, and 1891.

* On the first January, 1886, the Union or Superintendent Registrar's District of Newport was dissolved, and its area incorporated with abolished, and its area distributed among the Superintendent Registrars' Districts of Abbeyleix, Roscrea, and Urlingford; and on the first Districts of Omagh and Strabane. In the several Abstracts and Tables in this Supplement the Marriages, Births, Deaths, &c., are given

to the Acts 7 & 8 Vic., c. 81, and 26 & 27 Vic., c. 90, in the Ten Years 1881–90.

MARRIAGES, BIRTHS, and DEATHS *registered* in Ireland in the Ten Years, 1881-90.

I.—PROVINCE OF LEINSTER.—MARRIAGES, BIRTHS, AND DEATHS, 1881-90.

SUPERINTENDENT REGISTRARS' DISTRICTS, ARRANGED BY COUNTIES.

Wherever the minus sign (—) is prefixed to the number given in the column headed "Excess of Births over Deaths," it denotes that the births, instead of exceeding the deaths, were, in fact, *less than the Deaths* to the extent stated.

No.	SUPERINTENDENT REGISTRARS' DISTRICTS.	POPULATION. 1881.	POPULATION. 1891.	TOTAL. MARRIAGES.	TOTAL. BIRTHS.	TOTAL. DEATHS.	BIRTHS. Including Illegitimate Births. Males.	BIRTHS. Including Illegitimate Births. Females.	BIRTHS. Illegitimate Births. Males.	BIRTHS. Illegitimate Births. Females.	DEATHS. Males.	DEATHS. Females.	Excess of Births over Deaths.

REPORT

TO

HIS EXCELLENCY ROBERT OFFLEY ASHBURTON, BARON HOUGHTON,

&c., &c., &c.,

LORD LIEUTENANT-GENERAL AND GENERAL GOVERNOR OF IRELAND.

MAY IT PLEASE YOUR EXCELLENCY,—

I have the honour to submit, for your Excellency's consideration, the Thirtieth Annual Report on Marriages, Births, and Deaths in Ireland.

GENERAL SUMMARY.

The Marriages registered in Ireland during the year 1893 number 21,714; the Births 106,082; and the Deaths 82,821. The marriage rate was slightly above the average for the preceding ten years, the birth rate showed a small decline and the death rate was also under the average.

The recorded natural increase of population, or excess of births over deaths, was 23,261: the loss by emigration amounted to 48,147; there would thus appear to have been a decrease of 24,886 in the population during the year, but against a portion of this decrease there is a set-off in immigration, of which no official record has been obtained. The estimated population in the middle of the year was 4,615,312.

TABLE I.—Showing for each of the years 1883–93, the estimated **Population**; the number of **Marriages**, **Births**, and **Deaths** registered, and the number of **Emigrants** enumerated, with the rates per 1,000 of the estimated Population represented thereby; and the averages for the ten years 1883–92.

YEARS.	**Estimated* Population in the middle of each year.	Numbers *Registered.*			Number of Emigrants as returned by the Enumerators.	Rate per 1,000 of Estimated Population.			
		Marriages.	Births.	Deaths.		Marriages.	Births.	Deaths.	Emigrants.

* See page 189.

There are 2,618 Local Registration Officers holding office directly under the Department or who have entered into bonds with the Registrar-General for the due discharge of their duties. During the year 1893, 558 cases of vacancies or appointments were dealt with.

I append a table showing the number of Searches, &c., at the General Register Office since the commencement of the Acts for the Registration of Births and Deaths and of Roman Catholic Marriages in 1864. It will be observed that the steady increase in the number of searches and in the number of certified copies issued was maintained in 1893.

TABLE II.—NUMBER of SEARCHES made; number of CERTIFICATES issued, and Amount received as FEES for SEARCHES, &c., at the GENERAL REGISTER OFFICE, DUBLIN, during the 30 years 1864–93.

YEARS.	Annual Number of Searches in the Registers.	Annual Number of Certificates.	Amount received as Fees for Searches, &c., and paid into Her Majesty's Exchequer.	YEARS. During the financial year ended 31st March last 670 cases were reported of offences against the Acts administered by this Department. On careful inquiry into the circumstances, in 190 cases prosecutions were ordered to be instituted against the offenders. In 103 of these the parties were convicted and punished; in 81 the proceedings were abandoned, the parties (in most instances) paying the costs of court and complying with the law; and in 6 cases the summonses were dismissed.

The cases dealt with included the following offences:—Neglect to register Births, neglect to register Deaths, neglect to furnish Certificate of Marriage, failure of Coroner to furnish Certificate of Inquest; giving false information as to age at death, as to cause of death, and as to duration of illness previous to death; giving false information as to Births, viz.—registering illegitimate children as legitimate, and misrepresenting date of birth; neglect of Medical Practitioner to furnish Certificate of Cause of Death; neglect of Registrar to furnish certified copies of entries in his Register Books; burying two bodies in one coffin without due notice.

The administration of the legal work of the office is, as mentioned in previous Reports, entrusted to Mr. Matheson, whose detailed statement of the business transacted will be found at page 194.

MARRIAGES.

I regret to state that in 29 cases returns relating to a portion of the year 1893 have not yet been furnished by the clergy of the Church of Ireland, and in 7 instances by the Presbyterian clergy connected with the General Assembly. The number of marriages celebrated in the majority of these churches is known to have been small, and would not appreciably affect the general statistical results for Ireland, but nevertheless it is unsatisfactory to have to notice even any omissions to comply with Sec. 65 of 7 & 8 Vic., cap. 81, under which these returns are required from the clergy.

The number of Marriages registered during the year is 21,714, being equal to 1 in every 213, or 4·70 per 1,000, of the estimated population,* a rate which is ·06 over that for the previous year, and ·30 above the average for the ten years 1883–92.

Of the 21,714 Marriages registered during the year 1893, 15,092 were between Roman Catholics; 3,546 were celebrated according to the rites and ceremonies of the Church of Ireland; 2,295 were in Presbyterian Meeting-houses; 385 in "Registered Buildings" belonging to various religious denominations; only 375 by civil contract in the Registrars' offices; 11 were according to the usages of the Society of Friends; and 10 according to the Jewish rites.

The Roman Catholic Marriages are equal to a rate of 4·34 per 1,000 of the estimated number of Roman Catholics, and the other Marriages represent a rate of 5·83 per 1,000 of all persons other than Roman Catholics in the population.

Of the 3,546 Marriages according to the rites of the Church of Ireland, 60 were by special licence, 2,999 by licence, 428 after the publication of banns, 5 on Registrar's certificate, and in 54 instances there was no information afforded as to which of these methods was adopted.

* Throughout this Report the rates for the total of Ireland are based on the estimated population in the middle of the respective years.

TABLE IV.—**Marriages** registered in Ireland in 1893 and each of the previous ten years, according to the **modes of celebration**; with the **rate** per 1,000 of the population represented:—

During the year 1893 there were issued by the Registrars 698 Licences for Marriage in Registered Buildings and in the Registrars' offices.

The number of Marriage Licences issued by the licensing Ministers of the several Presbyterian bodies is given in the following summary:—

Presbytery or Synod.	Number of Licensing Ministers on 31st December, 1893.	Number of Registered Meeting-houses on 31st December, 1893.	Number of Licences issued.
1. General Assembly of the Presbyterian Church in Ireland,	146	573	2,193
2. Remonstrant Synod of Ulster,	8	19	36
3. Presbytery of Antrim,	4	7	5
4. United Presbytery or Synod of Munster,	2	2	1
5. Northern Presbytery of Antrim,	2	5	7
Total,	162	606	2,242

There being no civil restrictions as to the time or place for celebrating marriages between Roman Catholics in Ireland, a registration of the churches and chapels of the Roman Catholic Church is not necessary for the purposes of this office; but with reference to other religious bodies, a record is kept of the places of Divine worship in which marriages may lawfully be solemnized without special licence, and from this it appears that, on the 31st December, 1893, there were 1,489 churches and chapels of the Church of Ireland, 606 registered Presbyterian Meeting-houses, and 369 "Registered Buildings" belonging to various religious denominations. Compared with the previous year, these numbers show a decrease of 1 as regards the Church of Ireland, an increase of 3 in the number of Presbyterian Meeting-houses, and an increase of 1 "Registered Building."

The following statement shows the several religious bodies having "Registered Buildings" in 1893:—

Denominations.	No. of Places of Worship.
Methodists,	217
Reformed Presbyterians,	37
Independents,	25
Baptists,	21
Christian Brethren,	11
Salvation Army,	10
Seceders,	10
United Presbyterians,	9

Denominations.	No. of Places of Worship.
Moravians, or United Brethren,	8
Methodists, New Connexion,	7
Evangelical Union,	2
"The Catholic Apostolic Church,"	2
Jews,	2
Non-Subscribing Unitarians,	1
Unitarians,	1

Denominations.	No. of Places of Worship.
Covenanters,	1
Welsh Presbyterians,	1
United Original Seceders,	1
"Protestant Dissenters,"	1
Non-Subscribing Christians,	1
Independent Protestants,	1
Total,	369

As more than a moiety of the annual number of Roman Catholic marriages in the provinces of Munster and Connaught are celebrated between Christmas and Shrovetide, the marriages registered in Ireland during the first quarter of the year always largely outnumber those in any of the other quarters. In 1893, the numbers recorded were—in the first quarter 6,777; in the second, 5,183; in the third, 4,851; and in the last, 4,903.

The marriages of bachelors and spinsters constitute 86·6 per cent. of the total; those of widowers and spinsters 8·4 per cent.; of bachelors and widows 2·7 per cent.; and of widowers and widows 2·3 per cent. Thus, 10·7 per cent. of the men married were widowers, and 5·0 per cent. of the women were widows; and in 13 instances in every 100 marriages one or both of the contracting parties had been in the married state before.

TABLE V.—Showing by QUARTERLY PERIODS, the number of MARRIAGES registered in Ireland in each of the eleven years 1883–93, and the average number for the ten years 1883–92, distinguishing the number of Roman Catholic marriages registered under the 26 & 27 Vic., cap. 90, and of Protestant and other marriages under the 7 & 8 Vic., cap. 81:—

A complete registry of the exact ages of the persons married would be valuable from many points of view: hence it is matter for regret that in the great majority of instances the ages are not recorded. The requirements of the law are technically complied with by the entry in the age column of "minor" or of "full age," as the case may be, and there seems to be a general and increasing inclination to take advantage of this circumstance, as in 1893 the ages of both parties were specified in 4,569 cases only, being little more than one-fifth of the total number of marriages. In the year 1865, when 30,802 marriages were registered, the ages of both parties were given in 13,910 instances.

Of 21,714 men married during the year, 398, or 1·83 per cent., were minors; and of the women married, 1,783, or 8·21 per cent., were under age. These proportions are considerably below the averages for the preceding ten years.

The highest proportion of husbands (2·09 per cent.) married under age in 1893, was in the province of Ulster, and in that province there was also the highest per-centage of wives (9·03), not of full age.

It may be added that the per-centage of persons married in Ireland who were under age is very far below the corresponding rates in England and Scotland.

The signatures of the contracting parties in the marriage registers or certificates afford a rough test of the progress of elementary education. In the year 1893, 17,815, or 82·0 per cent., of the husbands, and 17,947, or 82·7 per cent., of the wives, wrote their names, and the remainder signed by marks.

These figures, though still leaving much to be desired, contrast hopefully with the corresponding results eleven years since, the per-centage of persons married in 1883 who wrote their names being—men 74·9, and women 71·9.

The per-centages for the several provinces last year range, for men, from 75 in Connaught to 85 in Leinster, and, for women, from 79 in Connaught to 87 in Leinster.

In 1,869 cases, both of the parties married signed the register by "mark," and in 3,928 the register was thus signed by either the husband or the wife, so that in 5,797 cases, or 26·7 per cent. of the total number of marriages, one or both of the parties signed by mark; and in 15,917, or 73·3 per cent., *both* parties wrote their names.

The number of marriages registered in each of the eleven years 1883–93; the proportion per cent. of persons married who wrote their names in the registers; of minors, of widowers, and of widows are given in the following Table for Ireland, and for each of the four provinces.

TABLE VI.—Showing as regards the **Marriages** in Ireland and in each of the Four Provinces during the years 1883–93, the proportion per cent. of Persons who **signed their Names,** of Persons **not of Full Age,** and of **Re-marriages.** The figures for the years 1883–84 refer to Registration Provinces; those for 1885–93 to the Provinces Proper.

Provinces, &c.		Signed their Names in Writing.		Persons not of Full Age.		Re-marriages. Widowers.	Re-marriages. Widows.

	1893,	75·4	78·8	1·78	8·14	8·65	4·62

In proportion to population at all ages, the registered marriages were most numerous in the province of Ulster, in which, however, the rate was only 5·2 per 1,000 of the population, according to the Census of 1891; Leinster comes next, with 5·1 per 1,000; Munster third, with 4·1 per 1,000; and Connaught last, the rate being 3·3 per 1,000.

The highest rate for any county was 7·6 per 1,000 of the population in 1891, which was the marriage rate for Antrim; and the lowest 3·0 per 1,000, for Galway. Between these, the most favourable were 7·1 for Dublin, and 5·2 for Wicklow; and the least so 3·1 for Mayo and Clare, and 3·3 for Kerry.

BIRTHS.

The number of births registered during the year 1893 was 106,082—54,323 boys and 51,759 girls, or 105·0 of the former to every 100 of the latter—the rate afforded in proportion to the estimated population being 1 in 43·5, or 23·0 per thousand, which is 0·1 under the low average rate per 1,000 for the ten years, 1883–92.

Of the 106,082 children whose births were registered in Ireland during the year 1893, 103,326, or 97·4 per cent. were legitimate, and 2,756, or 2·6 per cent., were illegitimate: the average per-centage of illegitimate for the preceding 10 years was 2·7. It is unnecessary to say that these results compare very favourably with the returns for most other countries.

Of the children born in wedlock during the year, 52,925 were males, and 50,401 females, being 105·0 of the former to every 100 of the latter, and of the illegitimate children 1,398 were males, and 1,358 females, or 103·0 boys to 100 girls.

Comparing the provinces, we find that the per-centage of children born in Ulster, who were illegitimate, was 3·7; in Leinster, 2·5; in Munster, 2·2; and in Connaught, 0·7.

TABLE VII.—The Per-centage of **Legitimate** and of **Illegitimate** Births registered in Ireland during the years 1889–93, by Provinces.

Provinces.	Proportion per cent. of Legitimate Births.					Proportion per cent. of Illegitimate Births.				
	1889.	1890.	1891.	1892.	1893.	1889.	1890.	1891.	1892.	1893.
IRELAND, . . .	97·2	97·3	97·3	97·5	97·4	2·8	2·7	2·7	2·5	2·6
LEINSTER, . . .	97·5	97·5	97·6	97·8	97·5	2·5	2·5	2·4	2·2	2·5
MUNSTER, . . .	97·8	97·8	97·8	98·0	97·8	2·2	2·2	2·2	2·0	2·2
ULSTER, . . .	95·6	96·0	96·0	96·1	96·3	4·4	4·0	4·0	3·9	3·7
CONNAUGHT, . . .	99·3	99·2	99·3	99·5	99·3	0·7	0·8	0·7	0·5	0·7

The respective total birth-rates for the provinces in 1893 were—Leinster, 22·6 per 1,000 of the population in 1891; Munster, 21·7; Ulster, 23·8; and Connaught, 21·0.

The four counties having the highest rates are Antrim, 29·4 per 1,000 of the population in 1891; Down, 27·8; Dublin, 27·5; and Kerry, 22·9. Those with the lowest rates are—Monaghan, 17·4; Meath, 18·1; Cavan, 18·7; and Tyrone, 18·9.

Of the total births, 52·3 per cent. were registered in the first six months of the year (181 days), and 47·7 per cent. in the second half of the year (184 days).

The number registered in the first quarter was 27,204 ; in the second, 28,320 ; in the third, 26,098 ; and in the fourth, 24,460.

DEATHS.

The deaths registered during the year amount to 82,821, being equal to 1 in 55·7 or 17·9 per 1,000 of the estimated population. The deaths of males number 40,788, and those of females 42,033, the former being equal to 17·9 in every 1,000 males living, and the latter representing 18·0 per 1,000 females.

The death-rate (17·9) is 0·3 under the average rate for the preceding ten years, and 1·5 under the rate for the year 1892.

As usual, very many of the Registrars furnished at the close of each quarter valuable notes on the sanitary condition of their respective districts. These notes were embodied in the Quarterly Returns issued from this department, and emanating as they did, from gentlemen qualified to speak decisively on the subject, it is to be hoped that they received the serious attention of the various Local Authorities intrusted with the administration of the Public Health Acts.

With respect to the death-rates for the four provinces, the rate for Connaught is only 13·3 ; that for Munster is 16·6 ; for Ulster, 18·3 ; and for Leinster, 20·3 per 1,000 of the population in 1891.

Of the thirty-two counties, the four having the lowest registered mortality are—Sligo, 11·6 per 1,000 ; Leitrim, 13·0 ; Mayo, 13·0 ; and Cavan, 13·5.

Those in which the rate was highest are—Dublin, 25·2; Antrim, 22·8; Waterford, 20·5 ; and Carlow, 20·2.

The deaths registered in the first half of the year generally outnumber those in the second. In 1893, 52·0 per cent. of the total deaths were registered in the six months, January to June inclusive, and 48·0 per cent. in the remaining six months of the year.

The annual rates represented by the deaths registered in each quarter are as follow:—First quarter, 19·7 per 1,000 of the population ; second, 17·6 ; third, 15·5 ; and fourth, 19·0.

From the Table on pp. 172–181 *it will be seen that, of the* 82,821 *deaths registered during the year,* 2,302 *took place in Infirmaries and General and Special Hospitals ;* 1,081 *in Public Lunatic Asylums;* 9,339 *in Workhouses and Workhouse Hospitals; and* 70,099 *were of persons who died "At their Own Homes, &c." As in former Reports a Table* (*see pages* 182–3) *is given showing like information for those Registrars' Districts in which the principal Urban Sanitary Districts in Ireland are situated.*

The deaths in "Infirmaries and General and Special Hospitals" constitute 2·8 per cent. of the total number, the per-centages for the four provinces varying from 0·3 in Connaught to 7·0 in Leinster. Over eleven per cent. of the deaths registered occurred in Workhouses or Workhouse Hospitals, the respective per-centages for the provinces being—Leinster, 13·1 ; Munster, 16·6 ; Ulster, 7·2 ; and Connaught, 8·8.

TABLE VIII.—Showing, by **Quarterly Periods**, the number of **Births** and **Deaths** registered in Ireland in each of the eleven years, 1883–93, and the average number for the ten years, 1883–92.

I.—SPECIFIC FEBRILE OR ZYMOTIC DISEASES.

The number of deaths from Specific Febrile or Zymotic diseases registered during the year 1893 was 8,944 (4,276 males and 4,668 females), or 194 in every 100,000 of the estimated population, being 1,029 under the number for the preceding year, but 899 above the average for the ten years, 1883-92.

Of the 8,944 deaths from zymotic diseases 4,886, or 54·6 per cent., were amongst children under 10 years of age.

The deaths from the principal zymotic diseases* registered during 1893 form 8·0 per cent. of the deaths from all causes, and are equal to 143 in every 100,000 persons living; the average annual mortality from the same diseases in the preceding 10 years represented 7·4 per cent. of the average number of deaths from all causes, and was equal to 135 deaths in every 100,000 of the population.

* Small-pox, Measles, Scarlet Fever, Typhus, Whooping-cough, Diphtheria, Simple Continued and Ill-defined Fever, Enteric Fever, Diarrhœa, Dysentery, and Cholera.

TABLE X.—Showing the Number of Deaths from the Principal Febrile or Zymotic Diseases registered in the several Provinces of Ireland during each of the nine years, 1885–93; with the Rates per 100,000 of the Population.*

Small-pox.—One death from small-pox was registered during the year. In 1892 no deaths from this disease were registered, in 1891 it caused 7 deaths, but in the two

* The rates are based on the population according to the Census; the rates for the years 1885–6 being founded on the 1881 population, and those for the years 1887–93 on the population by the Census of 1891.

years preceding no fatal cases of it were recorded. The average annual number for the ten years 1883–92, was 5 only, so that in late years deaths from Small-pox have been of very rare occurrence in Ireland.

Measles.—Deaths from Measles, which in 1891 fell as low as 240, in 1892 amounted to 1,183, and were last year 1,082, or 189 in excess of the average for the ten years, 1883–92. The deaths from this disease in Belfast Union number 226, and those in the two Metropolitan Unions of Dublin North and Dublin South 101; in Limerick Union there were 52 fatal cases, and in Waterford Union 55, so that the deaths in these four Unions amounted to 434, or 40 per cent. of the number for the whole country. The total number for the province of Leinster is 307, for Munster 329, for Ulster 416, and for Connaught 30.

Scarlet Fever.—Deaths from Scarlet Fever, although more numerous than in any of the three years preceding, were far below the average for the ten years 1883-92, the number being 457 as compared with an average of 846. Of the 457 deaths registered last year, 114 occurred in Leinster, 32 in Munster, 197 in Ulster (of which 53 were in Belfast Union), and 114 in Connaught, the last number including 24 in Castlereagh Union, where 55 deaths from this disease were registered in the year 1892.

Diphtheria.—There were 411 deaths from diphtheria registered, being 125 over the number for the preceding year, and 79 in excess of the average for the ten years 1883–92. The 411 deaths consist of 79 in Leinster (including 24 in South Dublin Union), 54 in Munster, 247 in Ulster (including 22 in Ballymena Union, 52 in Belfast Union, 26 in Londonderry Union, and 22 in Strabane Union), and 31 in Connaught. In Ulster the rate represented by deaths from diphtheria was 15·2 per 100,000 of the population.

Whooping-cough.—Deaths from this disease, which had fallen from 1,280 in 1891, to 1,154 in 1892, were last year 1,169, or 25·3 per 100,000 of the population, being 4·8 under the average rate for the ten years 1883–92. The 1,169 deaths in 1893 were distributed as follows:—386 in Leinster (including 86 in the North, and 95 in the South Dublin Union, 49 in New Ross Union, and 33 in Rathdown Union), 228 in Munster, 464 in Ulster (of which 223 were in Belfast Union, and 27 in Strabane Union), and 91 in Connaught. The respective rates for the four provinces were—Leinster, 32·5 per 100,000 of the population; Munster, 19·4; Ulster, 28·6; and Connaught, 12·6.

Fever.—The total number of deaths from the several forms of continued fever was 1,285, being 93 over the number for the preceding year, but 303 below the average for the ten years 1883–92. The rate represented by the deaths for last year was 27·8 per 100,000 of the population, against an average of 32·7 for the preceding ten years. The deaths from "fever" in Leinster were equal to 39·6 per 100,000 of the population according to the Census of 1891; in Munster the rate was 27·2 per 100,000; in Ulster, 22·5; and in Connaught, 18·2.

The 1,285 deaths from "fever" consist of 227 from typhus (being 41 under the number for 1892, and 212, or 48 per cent. below the average for the ten years 1883–92), 919 from enteric fever, (being 205 over the number for 1892, 128 over the average for the ten years, and higher than the number in any of those years except 1889, when 968 deaths were recorded), and 139 from simple continued and ill-defined fever, being 219 below the average number under that heading in the preceding ten years. It will be observed from Table X., page 12, that as regards the distribution of the deaths through the four provinces, the highest rates for typhus were in Munster and Connaught, and the highest for enteric fever in Leinster and Ulster. The deaths from enteric fever in Dublin and Belfast form about 44 per cent. of the total number for Ireland; the disease was more fatal in the former city in 1893 than it had been during any of the three years preceding, but the mortality in Belfast, although higher than in 1892, is under that in the years 1890 and 1891. The respective numbers for Belfast Union were 190 deaths in 1890, 156 in 1891, 115 in 1892, and 131 in 1893, and for the two Unions of Dublin North and Dublin South, 168 in 1890, 185 in 1891, 132 in 1892, and 283 in 1893.

In proportion to the living at the same age, "fever" was most fatal at the age-periods 20 and under 25 years, and 25 and under 35, for the former of which the rate was 44·93 per 100,000, and for the latter 40·37, and least so amongst persons aged 75 and upwards, the rate being 8·24 per 100,000.

Erysipelas.—The number of deaths from erysipelas is 310, being 140 over the number for the preceding year, and 90 over the average for the ten years 1883–92.

Puerperal Fever.—The number of deaths from this disease is 384, being 84 over the average for the preceding ten years, and 109 over the number for the year 1892.

Influenza.—For the ten years 1864–73 (during the greater portion of which period there was not any epidemic outbreak of the disease), the average annual number of deaths from influenza registered in Ireland was 166, or 0·3 per 10,000 of the population, the yearly number ranging from 311 in 1864 to 96 in 1868; for the following ten years (1874–83) the average number was 82, the highest being 124 in 1875, and the lowest 39 in 1882; and for the six years, 1884–9, the average was 34 only, the numbers varying from 21 to 44. In 1890 the deaths from the disease amounted to 1,712, or 3·6 per 10,000 of the population; in the following year they fell to 891, or 1·9 in every 10,000 living; in the year 1892 they rose to 3,742, or 8·1 in every 10,000 of the population, and equal to 4·2 per cent. of the deaths from all causes, and last year they fell to 1,310, or 2·8 in every 10,000 of the population. In the province of Leinster the influenza death-rate in 1893 was 3·2 per 10,000 of the population; in Munster, 3·3; in Ulster, 2·5; and in Connaught, 1·9. The county rates range from 0·3 per 10,000 in Fermanagh County to 7·7 in Queen's County.

The Table (XII.) on the opposite page shows, by Sexes and Age-Periods, the distribution of the deaths from influenza through the several counties.

TABLE XII.—Showing, by Provinces and Counties, the number of Deaths from Influenza at each of five Age-Periods registered in Ireland during the year 1893, with the rate per 10,000 of the population represented by the deaths at all ages.

Diarrhœa and Dysentery.—The mortality from these diseases was considerably over the average, the number of deaths being 1,967, or 42·6 per 100,000 living, against an average of 1,383, or 28·6 per 100,000 for the ten years 1883-92. The number of deaths from these diseases in 1892 was 1,186.

The rate for Leinster in 1893 was 51·2 per 100,000 of the population; for Munster, 28·3; for Ulster, 57·7; and for Connaught, 12·8. Of the 608 deaths from diarrhœa and dysentery in the province of Leinster, 421 occurred in one or other of the two Unions of Dublin North, and Dublin South; and of the 934 deaths in Ulster, 547 were registered in Belfast Union.

Simple Cholera.—Two hundred and forty deaths were ascribed to this disease, the average for the previous ten years being 52. Of those recorded in 1893, 47 were in Leinster, 41 in Munster, 149 in Ulster (including 114 in Belfast Union), and 3 in Connaught.

Four males and 1 female died from *Hydrophobia.*

II.—Parasitic Diseases.

There were only 38 deaths from diseases of this class.

III.—Dietetic Diseases.

The deaths from dietetic diseases number 164; they comprise 155 from intemperance, 44 of which (42 males and 2 females) were caused by delirium tremens, and 111 (92 males and 19 females) come under the head of chronic alcoholism. The number of deaths from intemperance registered in the preceding year, also, was 155.

IV.—Constitutional Diseases.

From diseases termed "constitutional" there resulted 15,980 deaths (7,579 males and 8,401 females), affording a rate of 1 in 5·2 of all the deaths, and equal to 346 in every 100,000 of the population.

Phthisis or Pulmonary Consumption caused 9,869 deaths (4,666 males and 5,203 females), being equal to 213·8 in every 100,000 persons, against an average annual rate of 213·3 per 100,000 for the previous ten years.

As heretofore, Leinster and Ulster yield the highest rates, and Connaught the lowest. The rates for the four provinces are as follow:—Leinster, 236 per 100,000 of the population; Ulster, 229; Munster, 196; and Connaught, 147.

Of the 3,711 deaths from phthisis in Ulster, 1,102 occurred in Belfast union, the number being equal to 380 per 100,000 of the population according to the Census of 1891, and the 2,801 fatal cases of the disease in Leinster comprise 1,296, or 371 per 100,000 of the population, registered in the unions of Dublin North and Dublin South.

Of the total number of deaths from phthisis in Ireland, 7,394, or 75 per cent., were of persons aged 15 and under 45 years of age.

Mesenteric Disease.—The deaths from mesenteric disease number 971—483 males and 488 females.

Gout.—Only 32 deaths from gout were registered (19 males and 13 females).

Cancer.—There were 2,280 deaths (1,052 males and 1,228 females) tabulated under this heading, against an average of 2,063 for the ten years 1883–92.

The following Table shows, by Sexes and Age-periods, the deaths from Cancer registered during the year 1893, arranged according to the part of the body affected by the disease, in so far as that information was contained in the Returns; also the number of deaths to 100,000 of the living at same age. In 81 instances the organ or portion of the body affected was not stated. It will be observed from the Table that the deaths entered under the first ten headings therein, which relate to various parts of the head, neck, and throat, amount to 475, and that of these, 337, or more than two-thirds, were deaths of males; 553 of the classified cases were deaths from cancer of the stomach; 242 females died from cancer of the breast, and 166 females from cancer of the uterus. The Table shows also the total deaths from cancer in each of the ten years, 1883–92, arranged by Age-periods.

* Including 8, pancreas; 7, nose; 6, ovary; 4, spleen.

V.—Developmental Diseases.

The deaths in this class amount to 16,584, of which 16,119 (7,195 males and 8,924 females), or 19·5 per cent. of the deaths from all causes, were ascribed to "old age." Of the remaining 465 deaths, 358 are tabulated under the head of "premature birth"; 29 were caused by atelectasis, 13 by cyanosis, 49 by spina bifida; &c.

VI.—Local Diseases.

The number of deaths from "local diseases" registered amounted to 33,816 (17,390 males and 16,426 females), or 40·8 per cent. of the deaths from all causes.

Diseases of the Nervous System.—From this group of diseases there resulted 7,359 deaths—3,923 males and 3,436 females. They include 2,429 from convulsions (nearly all children), 1,393 tabulated under the head of "hemiplegia, brain paralysis"; 1,212 from apoplexy; 746 from inflammation of the brain or its membranes, 315 from epilepsy, 404 from insanity (general paralysis of the insane), 11 (5 males and 6 females) from chorea or St. Vitus's dance, 203 from softening of the brain, &c.

Diseases of the Circulatory System.—Diseases of the circulatory system caused 5,946 deaths—3,005 males and 2,941 females.

*Diseases of the Respiratory System.**—The number of deaths from these diseases is 13,714—7,063 males and 6,651 females—or 297·1 in every 100,000 of the population. In the preceding year 15,830 deaths from these causes were registered, and the average number for the ten years 1883–92 was 15,301 or 316·7 per 100,000 of the estimated mean population. The respective rates for the Provinces, in 1893, are Leinster, 321 per 100,000 persons; Munster, 303; Ulster, 298; and Connaught, 209.

Of the 13,714 deaths from these causes 8,543 (4,000 males and 4,543 females), resulted from bronchitis, being 1,890 under the number from that disease in the preceding year; 3,283 (2,114 males and 1,169 females) were from pneumonia or inflammation of the lungs; 604 from croup; 269 from asthma and emphysema; 218 from pleurisy; 104 from laryngitis, &c.

Diseases of the Digestive System.—These diseases caused 4,172 deaths (2,111 males and 2,061 females), including 413 from enteritis or inflammation of the bowels; 449 from peritonitis or inflammation of the covering of the bowels; 343 from ileus or obstruction of the bowels; 164 from hernia; 3 (1 male and 2 females) from fistula; 253—163 males and 90 females—from cirrhosis of liver; &c.

Diseases of the Urinary System.—To the various affections of this order of diseases 1,384 deaths (921 males and 463 females) were ascribed. Of these deaths, 596 (357 males and 239 females) were from Bright's disease, 197 from acute nephritis or inflammation of the kidneys; 18 from ischuria or suppression of urine; 21 from stone in the bladder; 33 from uræmia, &c.

The remaining deaths from Local Diseases comprise 57 from *Diseases of the Lymphatic System and of Ductless Glands*; 578 from *Diseases of the Reproductive System* (including 158 from diseases of the Organs of Generation, and 420 from the Accidents of Childbirth), 303 from *Diseases of the Organs of Locomotion;* and 244 from *Diseases of the Integumentary System.*

VII.—Violent Deaths.

The number of violent deaths registered during the year is 1,855 (1,290 males and 565 females), or 40·2 in every 100,000 of the population, being slightly over the average rate for the ten years 1883–92. Accidents or negligence caused 1,660 of these deaths (including 337 from burns or scalds and 319 from drowning); there were 63 cases of homicide (murder and manslaughter), and 129 of suicide, and 3 men were executed.

Inquests.—There were 2,171 inquests reported to the Registrars during the year 1893, being 1 inquest to every 38 deaths registered.

AGES.

Deaths of infants under 1 year old numbered 10,830, being equal to 10·2 per cent. of the number of births registered.

Amongst children under 5 years of age 17,496 deaths occurred—a mortality equal to 38·0 in every 1,000 of the estimated number of the living at that age. Of these, 9,349 were boys and 8,147 girls; the former number representing 40·0 in every 1,000 boys, and the latter 35·9 in every 1,000 girls under 5 years old.

* Exclusive of Phthisis, or Pulmonary Consumption, for which see "Constitutional Diseases."

The deaths of persons aged 65 years and upwards are equivalent to 9·3 per cent. of the living at that age.

Among the deaths registered are 611 of persons stated to have been aged 95 years or upwards—295 males and 316 females; of these 144 (66 males and 78 females) were returned as having been 100 years or upwards. In the absence of public records for remote periods, absolute verification of the ages of very old persons is not obtainable, but secondary inquiries having been made as regards persons returned during the year 1890 as centenarians, it was found, in almost every instance, that, so far as the Registrars could ascertain, the age was correctly stated.

EMIGRATION.

According to the Returns obtained by the Royal Irish Constabulary and the Metropolitan Police, who acted as enumerators at the several Irish seaports, the number of emigrants (natives of Ireland), who left Ireland during the year 1893 amounted to 48,147; of these 23,044 were males and 25,103 were females. Of the whole number, 6,322 were from the Province of Leinster; 19,820 from Munster; 10,525 from Ulster; and 11,480 from Connaught.

Of the total emigrants from Ireland in 1893, 8·0 per cent. were under 15 years of age; 85·0 per cent. were between 15 and 35 years old; 7·0 per cent. were 35 or upwards; and in 16 instances, the ages were not specified.

PRICES OF PROVISIONS, AND PAUPERISM.

The average price of the 4 lb. loaf in Dublin in the year 1893 was 5¾*d.*, being ½*d.* under the average price for the previous year.* Oatmeal (1st quality) averaged 15*s.* 1*d.* per cwt. in Dublin: the average price for 1892 was 15*s.* 5*d.*; the average prices of potatoes in Dublin ranged from 2*s.* 4*d.* to 3*s.* 3*d.* per cwt., against 2*s.* 2*d.* to 2*s.* 11*d.* in 1892; and those of beef from 44*s.* to 57*s.* per cwt., against 46*s.* to 58*s.* in 1892.

TABLE XIV.—AVERAGE PRICES in DUBLIN of BREAD, OATMEAL, POTATOES, and BEEF, during the years 1883–93, and the AVERAGE NUMBER of PERSONS in IRELAND receiving IN-DOOR and OUT-DOOR RELIEF on Saturdays in those years; also the AVERAGE PRICES of PROVISIONS and the AVERAGE NUMBER of PERSONS in RECEIPT of RELIEF during each quarter of the year 1893.

YEAR.	*Average* PRICES OF PROVISIONS.				PAUPERISM. *Average* NUMBER OF PERSONS RELIEVED.†	
	BREAD, 4-lb. Loaf.*	OATMEAL (Corn Exchange), per Cwt. (1st quality)	POTATOES (at Potato Market), per Cwt.	BEEF (at the Dublin Cattle Market), per Cwt.	In-door.	Out-door.

* Prices for the years 1883–7, and the first two quarters of 1888, were derived from Returns furnished by Messrs. Manders & Co., those for the third and fourth quarters of 1888 and for the years 1889–93 from Returns received from "Bolands, Limited," and Messrs. Johnston & Co. (or Johnston, Mooney, and O'Brien, Limited)—the prices quoted for these two firms including delivery.

† Compiled from Returns furnished by the Local Government Board.

Surveying the period covered by the several Tables in this Report, *i.e.*, 1893, and the ten years preceding, it is found that beef was lowest in the year 1887, when the average prices ranged from 44*s.* to 53*s.* 6*d.* per cwt.; oatmeal (1st quality), was cheapest in 1889, when the average price was 13*s.* 7*d.* per cwt.; and potatoes, in 1888, when the average range of prices was from 2*s.* 2*d.* to 2*s.* 9*d.* per cwt. The highest average price of oatmeal was 17*s.* 6*d.* in 1884 and 1885; the highest range for potatoes, 3*s.* 9*d.* to 4*s.* 10*d.* per cwt. in 1883, and for beef, 66*s.* 6*d.* to 77*s.* per cwt. in 1883.

From Returns, for which I am indebted to the Local Government Board, it appears that the average number of workhouse inmates in Ireland on Saturdays during the year 1893 was 41,836, being 254 over the average for the preceding year; and that the average number of persons receiving out-door relief was 57,901, or 1,833 under the corresponding number for 1892.

THE WEATHER.

The following particulars and those given on pages 22–44 and pages 184–5, which are inserted by the kind permission of the Editor of the Dublin Journal of Medical Science, have been derived from Returns of Meteorological Observations taken in Dublin City during the years 1873–93, by J. W. Moore, Esq., M.D., F.R.C.P.I., F.R. MET. SOC.; and published in the Journal during the years 1893–94. The Tables on pages 186–8 also, are founded on Dr. Moore's observations.

The mean Atmospherical Pressure has been obtained from daily readings of the barometer at 9 A.M. and 9 P.M., corrected and reduced to 32° Fahrenheit at the mean sea level. The Mean Temperature values have been deduced from the maximal and minimal readings of the thermometer in the shade. The Rainfall is that measured daily at 9 A.M. A *rainy day* is one on which at least one-hundredth (·01) of an inch of rain falls within the twenty-four hours from 9 A.M. to 9 A.M.

The *Mean Height of the Barometer* during the year 1893 was 29·954 inches. The highest observed reading was 30·706 inches at 9 A.M. on December 30th. The lowest observed reading was 28·530 inches, at noon on December 10th. The extreme range of atmospherical pressure was 2·176 inches compared with 1·804 inches in 1892.

The *Mean Temperature* of the year, deduced from the arithmetical mean of the maximal and minimal readings of the thermometer in the shade was 51·5°. The highest reading was 79·8° on August 15th; the lowest reading was 20·2° on January 3rd. The average mean temperature for the years 1873–92 calculated in the same way, was 48·5°. The mean temperature deduced from the daily readings of the dry bulb thermometer at 9 A.M. and 9 P.M. was 50·5°.

Rain fell on 174 days, including snow or sleet on 17 days, and hail on 21 days. The average number of rainy days in the years 1873–92 was 197·1. The total rainfall measured 20·493 inches compared with an average of 27·929 inches in the twenty years 1873–92. During the first half of 1893 (January to June, inclusive) the rainfall was 9·624 inches on 78 days; during the second half (July to December, inclusive) 10·869 inches fell on 96 days.

As regards the *Direction of the Wind*, 730 observations were made during the year, with this result—N., 50; N.E., 50; E., 86; S.E., 47; S., 50; S.W., 99; W., 215; N.W., 96; Calms, 37.

I have the honour to be

Your Excellency's faithful servant,

THOS. W. GRIMSHAW,

Registrar-General.

GENERAL REGISTER OFFICE,
CHARLEMONT HOUSE,
Dublin, 17th September, 1894.

METEOROLOGICAL OBSERVATIONS

FOR EACH MONTH OF THE YEAR 1893.

By J. W. MOORE, Esq., M.D., F.R.C.P.I., F.R. MET. SOC.

(Extracted from the *Dublin Journal of Medical Science.*)

JANUARY.—The promise of a cold month offered by very severe weather during the first ten days or a fortnight was not fulfilled. So decided was the recovery of temperature after the 15th, that the mean temperature of the whole month scarcely fell below the average. The mean temperature of the 1st-14th, inclusive, was 36·0° ; that of the 15th-28th, inclusive, was 44·3°. Ireland escaped to a remarkable extent, the Siberian cold which prevailed on the Continent of Europe, and to a less degree in Great Britain throughout a large portion of the month. In Dublin the cloudiness of the sky was one of the chief features of the weather. Another interesting point was the singular mildness, which the northerly and north-westerly winds of an Atlantic anticyclone brought to Ireland in the period between the 15th and the 25th.

In Dublin the arithmetical mean temperature (40·8°) was slightly below the average (41·4°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 40·1°. In the twenty-eight years ending with 1892, January was coldest in 1881 (M. T.=32·2°), and warmest in 1875 (M. T.=46·6°). In 1867 the M. T. was 35·7°, and in 1865 it was 37·8°. In 1871 and in 1886 the M. T. was 37·9° ; in 1879 (the "cold year") it was 35·3°. In 1888 the M. T. was 42·1° ; in 1889, 42·4° ; in 1890, 44·5° ; in 1891, 40·1° ; and in 1892, 38·8°. As a general rule, January in Dublin is not colder, but a shade warmer, than December. This is owing to the full development in January of a winter area of low pressure over the Atlantic, to the north-westward of the British Isles, and to a resulting prevalence of S.W. winds in their vicinity. January, 1892, proved an exception to this rule, the M. T. being 4·2° below that of December, 1891 (43·0°). But January, 1893, conformed to the rule, the M. T. being above that of December, 1892.

The mean height of the barometer was 30·053 inches, or 0·179 inch above the corrected average value for January—namely, 29·874 inches. The mercury rose to 30·559 inches at 7 30 a.m. of the 21st, and fell to 29·178 inches at 9 p.m. of the 28th. The observed range of atmospherical pressure was, therefore, as much as 1·381 inches—that is, a little less than one inch and four-tenths.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 40·1°, or 1·2° above the value for December, 1892. Using the formula, *Mean Temp.*=*min.* + (*max.*—*min.* × ·52), the M. T. becomes 41·0°, compared with a twenty-five years' average of 41·5°. The arithmetical mean of the maximal and minimal readings was 40·8°, compared with a twenty-five years' average of 41·4°. On the 30th the thermometer in the screen rose to 54·9°—wind, W.S.W. ; on the 3rd the temperature fell to 20·2°—wind, W.N.W. The minimum on the grass was 14·4°, also on the 3rd.

The rainfall was 2·239 inches, distributed over 19 days. The average rainfall for January in the twenty-five years, 1865-89, inclusive, was 2·200 inches, and the average number of rainy days was 17·3. The rainfall, therefore, was very slightly above the average, while the number of rainy days was more decidedly above it. In 1877 the rainfall in January was very large—4·322 inches on 25 days ; in 1869, also, 4·258 inches fell—on, however, only 18 days. On the other hand, in 1876, only ·406 of an inch was measured on but 9 days ; and in 1880, the rainfall was only ·563 of an inch on but 8 days. In January, 1886, only 3·244 inches of rain were measured on as many as 26 days ; in 1887 ("the dry year"), 1·816 inches fell on 16 days ; in 1888, 1·247 inches on 9 days ; in 1889, 2·213 inches on 16 days ; in 1890, 2·975 inches on 21 days ; in 1891, only ·672 of an inch on 14 days, and in 1892, 1·698 inches on 20 days.

Solar halos were seen on the 15th and 25th. A Lunar halo was seen on the 28th. The atmosphere was foggy on the 2nd, 4th, 12th and 29th. High winds were noted on not less than 18 days, reaching the force of a gale, however, on only 4 days—the 7th, 8th, 16th, and 28th. Hail fell on the 3rd, 7th, 14th, and 31st, and snow or sleet on the 1st, 2nd, 7th, and 14th. Temperature exceeded 50° in the screen on 7 days, compared with 6 days in 1892, only 5 days in 1891, 17 days in 1890, and 8 days in 1889 ; while it fell to or below 32° in the screen on only 4 nights, compared with 15 nights in 1892, 7 nights in 1891, and 1 night in 1890, and 3 nights in 1889. The minima on the grass were 32°, or less, on 16 nights, compared with 25 nights in 1892, 21 nights in 1891, 15 nights in 1890, and 16 nights in 1889.

The first week of 1893 will long be remembered for the intensity of the cold which prevailed in both Northern Hemispheres, and for the remarkable height reached by the barometer in Northern and Eastern Europe—31·25 inches at Archangel on Tuesday, the 3rd, 31·12 inches at Haparanda, on the Gulf of Bothnia, on Wednesday, and 31·27 inches at Moscow on Thursday. At 8 a.m. of Sunday, the 1st, the thermometer stood at *minus* 37° Fahr. at Haparanda, or 69° below freezing point. During the ensuing night the minimal reading at this station was —40°, or 72° of frost. At the beginning of the month a vast anticyclone stretched from the extreme North of Europe to the westward of the British Islands. Strong S.E. winds blew in Ireland, and on Monday morning a fall of snow occurred in Dublin. This was followed by severe frost, the thermometer falling to 20·2° in the screen, and to 14·4° on the ground during Monday night, even in the heart of the city. On Wednesday the 4th, a decided change of weather set in over Ireland, where the sky became densely overcast, with freshening S.E. winds and rising temperature. In Great Britain at this time the frost only "stiffened," and fog prevailed. By the end of the week, however, strong S.E. or E. winds, with falls of cold rain and sleet or snow had become general, and the weather was most inclement in all parts. In Dublin the mean height of the barometer was 30·110 inches, pressure

ranging from 30·369 inches, at 9 a.m. of Wednesday (wind calm), to 29·763 inches at 9 p.m. of Saturday (wind, E., blowing a moderate gale). The corrected mean temperature was 33·2°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 32·5°. The screened thermometers rose to 38·9° on Friday, having fallen to 20·2° on Tuesday. The rainfall amounted to ·624 inch on five days, ·372 inch being registered on Saturday. The precipitation consisted largely of snow or sleet and hail. The prevalent wind was S.E. A noteworthy feature was the relatively high temperature which accompanied this wind in the south-western parts of England and Ireland, and in Brittany.

Although the cold in Ireland and in Great Britain also was much less intense during the week ended Saturday, the 14th, than in the two previous weeks, the record is again one of winterly weather. At the beginning of the period a large area of low atmospherical pressure was found over the Atlantic south-westward of the British Isles. Strong E. and S.E. winds or gales were blowing in Ireland, where also cold rain or sleet fell heavily. During the next two days the depression made its way across the Bay of Biscay and France to Germany, bringing with it to those countries higher temperatures and a thaw. Meanwhile an area of high pressure formed in the far North, causing easterly to northerly winds, and cloudy, cold weather generally. This system subsequently retreated in a south-westerly direction, and disappeared off the S.W. of Ireland on Friday, when a series of depressions was preparing to travel southwards across the British Isles and North Sea. In front of these disturbances a transitory rise of temperature took place on Friday, and rain fell at night. On Saturday, however, rain gave place to frequent showers of sleet, snow, and hail, as the wind veered to N. and N.E. in the rear of the depressions, which continued their southerly course. In Dublin the mean height of the barometer was 30·090 inches, pressure ranging from 29·616 inches, at 2 p.m. of Sunday (wind, E), to 30·440 inches, at 9 a.m. of Wednesday (wind, E.N.E.). From this high reading it receded to 29·764 inches, at 9 a.m. of Saturday (wind, W.N.W.). The corrected mean temperature was 38·8°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 38·3°. On Friday the screened thermometers rose to 44·4°; on Saturday they fell to 33·0°. The rainfall was ·368 inch on four days, ·228 inch being measured on Sunday. The prevailing winds were— first easterly, then north-westerly.

The most marked characteristic feature in the weather of the week ended Saturday, the 21st, was a decided advance in temperature all over the British Islands, but especially in Ireland, Scotland, and the West of England (including Wales). In France and Germany, on the contrary, the cold "stiffened" daily until Friday, when warmer weather spread in from the Atlantic over the Continent also. A very interesting circumstance is that the milder weather came with N.W. and N. winds, which formed part of the circulation round an anticyclone found generally over the Atlantic to the westward or south-westward of Ireland. On Tuesday morning also a *southerly* wind carried cold weather from the frozen Continent to the S.E. of England, where the thermometer remained all day below the freezing point. Not for many years has such extreme cold been felt in Germany and France as during the greater part of this week—at Munich the minima have been—11°,—15°,—14°,—8°,—8°, +1°, and + 19°; at Lyons the corresponding values have been+11°,—3°,—1°, (?), 0°, + 3°, +4° (?), and + 17°. During all this time temperatures as high as from 48° to 52° were being recorded on the Atlantic coasts of both the United Kingdom and France. In the interval between Wednesday and Friday a vast depression crossed the extreme northern parts of Scandinavia, bringing with it a thaw even to those high latitudes at a time when intense frost held as far south as Lyons and Munich. On Saturday cold weather was re-established in Scotland and Scandinavia. In Dublin the mean height of the barometer was 30·286 inches, pressure ranging from 29·816 inches at 2 p.m. of Monday (wind, N.W.) to 30·559 inches at 7.30 a.m. of Saturday, (wind, W.N.W.). The corrected mean temperature was 42·9°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 42·4°. On Sunday the thermometers in the screen fell to 29·5°; on Thursday they rose to 50·8°. Rain was measured on four days to the amount of ·341 inch, of which ·277 inch fell on Sunday. The prevailing winds were W.N.W. and W.

A further advance in temperature occurred during the week ended Saturday, the 28th, which proved open, changeable, and breezy, with prevalent westerly to southerly winds. At first an anticyclone lay to the southward of Ireland—on the morning of Sunday, the 22nd, the barometer stood as high as 30·60 inches at Corunna, in the N.W. of Spain—while several shallow depressions were found over the North Sea, Germany, and the Baltic. The winds curved from S.W. in the west of Ireland, through W. in the east of this country to N.W. in the S.E. of England, and to N. in parts of France. The weather was mild and damp, and light rain fell at many stations. On Wednesday morning a depression appeared off the south of Ireland, ultimately forming portion of a complex V-shaped depression, which caused southerly gales, and in places heavy rains during the ensuing 24 hours. As this disturbance passed off to the northward a sharp but temporary dip in temperature took place. On Friday another and more serious depression advanced over Ireland from S.S.W., bringing with it southerly gales, a renewed rainfall, and generally broken weather, which lasted to the close of the week. In Dublin the mean height of the barometer was 29·914 inches, pressure ranging from 30·412 inches, at 9 a.m. of Sunday (wind, W.), to 29·178 inches, at 9 p.m. of Saturday (wind, S.). The corrected mean temperature was 45·7°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 44·4°. On Tuesday the screened thermometers rose to 53·0°; on Friday they fell to 37·4°. The rainfall was ·389 inch on five days, ·124 inch being measured on Friday, and ·240 inch on Saturday. The prevailing winds were W. and S. to S.S.E. A lunar halo was visible at 9 p.m. of Saturday.

Sunday, the 29th, was a fine mild day. The 30th was very mild, but changeable. On the 31st the heaviest rainfall of the month occurred at night, and hail fell in places in the afternoon.

In Dublin, the rainfall up to January 31, 1893, amounted to 2·239 inches on 19 days, compared with a twenty-five years' (1865–1889) average of 2·200 inches on 17·3 days.

At Knockdolian, Greystones, Co. Wicklow, 3·380 inches of rain fell on 18 days. The heaviest falls in 24 hours were ·510 inch on the 7th, and ·575 inch on the 28th.

The rainfall in January at Cloneevin, Killiney, Co. Dublin, amounted to 2·93 inches, on 19 days. The average rainfall for January at this station is 1·75 inches on 15·5 days. Both rainfall and rainy days were, therefore, considerably in excess this year. The greatest rainfall in 24 hours was ·52 of an inch on the 28th.

February.—The month now under review was, like February, 1892, wet, cold, stormy, and cloudy. Rain or snow fell in measurable quantity on 22 out of 28 days, and on 4 days the wind reached the force of a gale in Dublin. On the 9th, 14th, 21st, and 26th, atmospherical depressions with minima much below 29 inches were found crossing the British Islands. On the 21st and 26th the centres passed over the south of England.

In Dublin the mean temperature (42·7°) was 0·1° below the average (42·8°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 41·7°. In the twenty-eight years ending with 1892, February was coldest in 1873 (M.T.=37·9°), and warmest in 1869 (M.T.=46·7°). In 1886 the M.T. was 39·7°. In the year 1879 (the "cold year") it was 40·1°. In 1888 it was as low as 38·6°; in 1889 it was 40·3; in 1890 it was 41·5°; in 1891 it was as high as 44·7°; and in 1892 it was 41·3°.

The mean height of the barometer was 29·604 inches, or 0·251 inch below the average value for February—namely, 29·855 inches, and ·794 inch below the mean pressure in February, 1891. The mercury rose to 30·218 inches at 9 p.m. of the 4th, and fell to 28·790 inches at 7.30 a.m. of the 14th. The observed range of atmospherical pressure was, therefore, 1·428 inches—that is, a little less than an inch and a half.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 41·7°, or 1·6° above the value for January, 1893. Using the formula, *Mean Temp.* = *Min.* + (*max.*—*min.* × ·50), the M.T. becomes 42·7°, compared with a twenty-five years' average of 42·8°. On the 18th the thermometer in the screen rose to 56·4°—wind, S.W.; on the 25th the temperature fell to 26·0—wind, W.S.W. The minimum on the grass was 23·0°, on the 28th.

The rainfall was 2·669 inches, distributed over 22 days. The average rainfall for February in the twenty-five years, 1865–89, inclusive, was 2·150 inches, and the average number of rainy days was 17·2. The rainfall, therefore, was decidedly above the average, while the rainy days were also much above it. In 1883 the rainfall in February was large—3·752 inches on 17 days; in 1879, also, 3·706 inches fell on 23 days. On the other hand, in 1873, only ·925 of an inch was measured on but 8 days; in 1890, only ·802 of an inch fell on but 7 days; and in 1887 only ·541 of an inch fell on 11 days. The rainfall in 1887 was much the smallest record in February for very many years. But the record for 1891 is probably unparalleled—·042 inch on 2 days. The nearest approach to this drought was in September, 1865, when only ·056 of an inch of rain was measured on but 3 days. In 1892, the rainfall was 2·119 inches, on 19 days.

There was no snow, sleet, or hail in Dublin in February, 1891, but in the present month snow or sleet fell on 7 days—the 11th, 12th, 22nd, 23rd, 24th, 25th, and 26th; while hail was observed on 6 days—the 7th, 20th, 21st, 22nd, 23rd, and 25th.

The atmosphere was foggy on 3 days—namely, the 26th, 27th, and 28th. The amount of cloud —68·2 per cent.—was in excess of the average—66 per cent. High winds were noted on 11 days, reaching the force of a gale on 4 occasions—namely, the 7th, 9th, 10th, and 14th.

The temperature reached or exceeded 50° in the screen on 13 days, compared with 6 days in 1892, and as many as 14 days in 1891; while it fell to or below 32° in the screen on 5 days, compared with 5 days in 1892, and with 2 days in 1891. The minima on the grass were 32°, or less, on 13 nights, compared with 16 nights in 1892, and 17 nights in 1891. On 3 days the thermometer failed to rise to or above 40° in the screen.

Lightning was seen on the night of the 7th. There was an aurora on the night of the 16th. Solar halos were seen on the 15th and 28th, a lunar halo was seen on the evening of the 28th.

During the first four days of the month open but changeable and often rainy weather prevailed in the British Islands. At first it was mild also in France and Germany, but intense frost prevailed in the Gulf of Bothnia, whence a high pressure system with its accompanying cold spread southwards and westwards from Northern over Western Europe before the close of the period. On the night of Wednesday, the 1st, thunder and lightning occurred at Belmullet, Co. Mayo, and rain fell heavily at many Irish stations—·440 inch in Dublin and ·480 inch in the Phœnix Park. As the cold spread from the Baltic over Norway in one direction, and to Denmark, Germany, and England in another, the weather became finer and drier. In Dublin, the 3rd and 4th were quite spring-like days.

During the week ended Saturday, the 11th, open but blustering, rainy, and generally unsettled weather prevailed in Western Europe. At the beginning, no doubt, it was cold in England, very cold on the continent, owing to the presence of an anticyclone in those parts; but even at that time mild southerly winds swept over Ireland and Scotland, keeping the thermometer well above freezing point. On Sunday night the shade thermometer fell to 26° at Loughborough, 24° in London, and 21° at Cambridge. At 8 a.m. of Tuesday temperature exceeded 40° at all British Stations, and touched 50° at Valentia Island, in Kerry. A series of depressions, each deeper than its predecessor, now began to approach the N.W. of Europe from the Atlantic. They caused S.W. to W. gales of considerable violence, and frequent and sometimes heavy rains. On Tuesday night severe squalls, with thunder and lightning, hail and rain, occurred over Ireland. The most serious disturbance of the week however, came in on Thursday afternoon. Its centre lay between the N.E. of Scotland and the S.W. of Norway on Friday morning—the barometer falling below 28·70 inches over that portion of the North Sea. Sleet and snow fell in Scotland, hail in Ireland, and thunder and lightning were again reported from several stations. On Saturday a general reduction of temperature took place, and cold rain and sleet fell in the afternoon. Very intense frost prevailed in the Baltic, over Finland and the North of Russia, all through this week—at Haparanda, on the Gulf of Bothnia, the 8 a.m. readings of the thermometer were + 1°, + 3°, − 1°, − 6°, − 35°, − 37°, and

—19° respectively. In Dublin the mean height of the barometer was 29·828 inches, pressure ranging between 30·205 inches at 9 a.m. of Sunday (wind, S.S.E.) and 29·346 inches at 9 p.m. of Thursday (wind, W.). The corrected mean temperature was 46·0°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 44·8°. On Monday and Tuesday the shade thermometer rose to 53·8°, falling on Saturday to 35·9°. The rainfall equalled ·762 inch on six days—·480 inch being measured on Thursday. The prevailing winds were—first, S., then W. Lightning was seen on Tuesday night, and sleet fell on Saturday.

The striking features in the meteorological conditions during the week ended Saturday, the 18th, were—first, the persistence of severe cold in the north of Europe (Scandinavia, Finland, and Northern Russia); second, the very disturbed state of the atmosphere over the North Atlantic to the west and north of the British Islands—four definite barometrical depressions of prime importance having skirted our Atlantic coasts within the period. These cyclonic systems caused, as is usual, very unsettled weather; severe gales were felt at times, rain or hail and sleet fell frequently, and the changes in temperature were sudden, fitful, and large. Sunday was cold and chiefly fine, but some local showers of sleet and hail fell. Monday was mild and changeable. At night a very deep depression approached Ireland, and at 8 a.m. of Tuesday the barometer was down to 28·63 inches at Mullaghmore, near Sligo, and to 28·79 inches even in Dublin. In the course of this day a violent S.E. gale was felt on the east coast of Scotland, while it blew hard from N.W. in Ireland, and from W. and S.W. in England. Aurora Borealis was seen on the nights of Wednesday and Thursday. On Friday afternoon a sudden rise of temperature took place. This high temperature was more than maintained on Saturday, which was spring-like in its mildness—dull, however, in England, although bright in Ireland. In Dublin the mean atmospherical pressure was only 29·534 inches, the barometer ranging from 29·848 inches at 9 p.m. of Sunday (wind, W.) to 28·790 inches at 7.30 a.m. of Tuesday (wind, W.). The mean temperature was 44·0°—highest, 56·4° on Saturday; lowest, 34·1° on Sunday. The mean dry bulb readings at 9 a.m. and 9 p.m. were 43·4°. Rain fell on five days, but only to the amount of ·257 inch, of which more than one-half (·143 inch) fell on Wednesday. The prevailing winds were W. and S.S.W.

Winter resumed its sway in the British Islands in the course of the week ended Saturday, the 25th, which began with mild, spring-like weather, and closed with frost and a snow-covered country. The most striking feature in the meteorological record for the period was the passage across the south of England in an east-north-easterly direction of a deep atmospherical depression in the interval between Monday night and Wednesday morning. In the South-east of England the barometer fell below 28·7 inches—to 28·65 inches at the mouth of the Thames—on Tuesday afternoon. The winds accompanying this system were not strong, but large quantities of rain, hail, and sleet fell in most districts. This inclement weather was all the more felt, as Sunday—while dull and rainy, though mild in Ireland—had been a spring-like day in most parts of England, except the S.W. Bright sunshine was enjoyed for many hours, and the thermometer rose to 59° and even 60° (at Loughborough) in the shade all over the central and south-eastern counties. During the following night temperature gave way quickly and never recovered itself during the remainder of the week, except in the S. of England for a few hours in front of the deep depression already referred to. In Dublin hail, or sleet and snow, fell daily on and after Monday; and on Saturday morning there was a considerable fall of unusually light and powdery crystalline snow at a temperature varying from 27° to 31°. On the night of Saturday a violent snowstorm occurred, followed by rain. The weather was extremely cloudy and dull, except on Monday, Friday, and Saturday. In Dublin the mean height of the barometer was only 29·312 inches. Atmospherical pressure ranged between 29·557 inches at 9 a.m. of Sunday (wind S.), and 28·916 inches at 7.30 a.m. of Tuesday (wind, N.N.E.). The mean temperature was 39·2°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 38·1°. On Sunday the thermometers in the screen rose to 52·6°. On Saturday they fell to 26·0°. The rainfall (which largely consisted of hail, snow, and sleet) measured ·993 inch, ·390 inch being referred to Wednesday. The prevailing winds were S.S.E. and E.

The last three days of the month were cold, changeable, but for the most part dry. There were sharp night frosts, and a solar halo was seen on the afternoon of the 28th, followed by a lunar halo at 8 p.m.

In Dublin, the rainfall up to February 28, 1893, amounted to 4·908 inches on 41 days, compared with 3·817 inches on 39 days in the same period in 1892, ·714 inch on 16 days in 1891, and a twenty-five years' (1865–1889) average of 4·350 inches on 34·5 days.

At Knockdolian, Greystones, Co. Wicklow, 3·890 inches of rain fell in February on 25 days; and 3·380 inches in January on 18 days. The total fall to February 28th inclusive was 7·270 inches on 43 days.

The rainfall in February at Cloneevin, Killiney, Co. Dublin, amounted to 2·60 inches on 23 days. The average rainfall for February at this station is 1·543 inches, on 11·6 days. Both rainfall and rainy days were, therefore, considerably in excess this year—in fact it was a very wet month. The greatest rainfall in 24 hours was ·48 of an inch on the 1st. Since January 1, the rainfall was 5·53 inches, on 42 days.

March.—A singularly dry, warm, sunny month—more like May than March. It broke the record as regards height of temperature, deficiency of rainfall, and clearness of the sky and bright sunshine. The arithmetical mean temperature was 5·0° above the average for the month and no less than 9·0° above that of March, 1892 (39·1°). It was even 0·8 above the mean temperature of March, 1868 (47·3°), which had proved the warmest March since these records began in 1865 up to the present year. The deficiency in the rainfall was equally striking, the only comparable year for drought in March being 1871, when, however, ·81[illegible] inch of rain fell on 12 days against ·288 inch on 8 days in 1893. Not one-half of the sky was on the average covered with clouds, and the air was often very dry; consequently, the diurnal range of temperature was large—hot sunshine by day being followed by sharp nights. This was markedly the case in central England, where on more than one occasion

during the latter half of the month the thermometer in the shade traversed more than 40° within a few hours.

In Dublin the arithmetical mean temperature (48·1°) was considerably above the average (43·1°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 46·5°. In the twenty-eight years ending with 1892, March was coldest in 1867 and 1883 (M. T. = 39·0°), and warmest in 1868 (M. T. = 47·3°). In 1876 the M. T. was 41·1°, in 1879 (the "cold year") it was 42·5°, in 1888 it was as low as 39·8°, in 1889 it was 44·0°, and in 1890 it was as high as 45·1°. In 1891, it was only 41·7°; and in 1892 it was as low as 39·1°. As a general rule, February in Dublin is only a shade colder than March. This is due to the fact that the Continental anticyclone usually embraces the British Isles and Scandinavia in March, causing easterly winds. In 1892 February was actually 2·2° warmer than March, but in the present year March was 5·4° warmer than February.

The mean height of the barometer was 30·085 inches, or 0·169 inch above the corrected average value for March—namely, 29·916 inches. The mercury rose to 30·411 inches at 9 a.m. of the 19th, having fallen to 29·267 inches at 9 a.m. of the 1st. The observed range of atmospherical pressure was, therefore, 1·144 inches—that is, more than an inch and one-tenth.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 46·5°, or 4·8° above the value for February, 1893. Using the formula, *Mean Temp.=min.* + (*max.—min.* × ·485), the M.T. becomes 47·9°. The arithmetical mean of the maximal and minimal readings was 48·1°, compared with a twenty-five years' average of 43·1°. On the 29th the thermometer in the screen rose to 64·8°—wind, W.S.W.; on the 17th the temperature fell to 34·0°—wind, W.N.W. The minimum on the grass was 29·0° on the 17th, and also on the 21st.

The rainfall was only ·288 inch, distributed over 8 days. The average rainfall for March in the twenty-five years, 1865–89, inclusive, was 2·061 inches, and the average number of rainy days was 16·5. The rainfall, therefore, was much below the average, while the rainy days were also much below it. In 1867 the rainfall in March was very large—4·972 inches on 22 days; in 1888, 3·753 inches fell on 18 days; in 1866, also, 3·629 inches fell on 21 days. On the other hand, in 1871, only ·815 of an inch was measured on 12 days, and in 1874 only ·953 of an inch fell on 12 days. In 1887 (the "dry year"), 1·485 inches of rain fell on 15 days; in 1889, 1·076 inches fell on, however, as many as 17 days; in 1890 the fall was as much as 3·693 inches on 17 days; but in 1891 only ·936 of an inch fell on 16 days, and in 1892 only ·991 of an inch on but 9 days.

The atmosphere was thick with dry smoke fog in the city on 8 days, viz., the 2nd, 3rd, 13th, 19th, 20th, 24th, 25th, and 27th. High winds were noted on 11 days, reaching the force of a gale, however, on only one occasion, the 1st. Snow or sleet occurred on the 16th and 17th; and hail fell on the 1st and 16th. The temperature exceeded 50° in the screen on as many as 26 days, compared with only 7 days in 1892, 9 days in 1891, and 19 days in 1890; while it never fell to 32° in the screen, whereas in March, 1892, frost occurred in the shade on as many as 16 nights. The minima on the grass were 32°, or less, on 12 nights, compared with 25 nights in 1892, 20 nights in 1891, and 16 nights in 1890. On 4 days the thermometer rose above 60° in the screen, while it never failed to reach 40°. In March, 1892, the thermometer did not rise to 40° in the screen on 9 days.

The first four days of the month were warm and changeable, with frequent rain or showers and variable, chiefly westerly, winds. As compared with the closing days of February a marked increase of atmospherical pressure occurred after Wednesday, the 1st. On that day a depression passed by the North of Ireland across Scotland towards Denmark. Temperature rose fast, and a considerable rainfall was reported from most British stations. A ridge of high pressure followed this disturbance, but on Friday, the 3rd, a shallower depression in the N., with a "secondary" in the S., again threw the weather into a cloudy, showery condition. Saturday, the 4th, however, proved fine, and for the most part bright in Ireland. On the 3rd the thermometer rose to 56·7° in the screen in Dublin.

Singularly favourable and mild weather for the time of year held over the British Islands throughout the week ended Saturday the 11th. The rainfall also was but slight except at some exposed stations in the N.W. of Ireland and N. of Scotland. In Scandinavia, however, conditions were far otherwise—severe cold and excessive gales and snow-storms being experienced. This state of things was brought about by the persistence of an anticyclone, in which at one time (Friday morning) the barometer touched 30·50 inches off the S.W. and S. of Ireland; while a series of atmospherical depressions of ever increasing intensity swept eastwards across Northern Europe. Of these disturbances the most serious was observed on Friday, at 8 a.m. of which day the barometer was down to 28·72 inches at Hernösand in Sweden as compared with the reading 30·50 inches recorded at the same time at Valentia Island, in Kerry. Fresh to strong westerly to north-westerly winds prevailed generally in the United Kingdom. At first the sky was very cloudy, but towards the close of the week the clouds dispersed and the air became very dry, so that the diurnal range of temperature was large—at Cambridge, on Wednesday, the maximum was 66°, the minimum was 37°. In Dublin the mean height of the barometer was 30·287 inches, pressure ranging between 30·403 inches at 9 a.m. of Wednesday (wind W.) and 29·996 inches at 9 p.m. of Saturday (wind S.W.). The corrected mean temperature was 48·4°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 46·9°. On Sunday and again on Tuesday the thermometer rose to 55·8° in the screen; on Friday it fell to 37·0° in the screen, and 31·4° on the grass. The rainfall was ·034 inch on one day—Monday. The prevalent winds were westerly and north-westerly.

The most striking feature in the meteorology of the week ended Saturday, the 18th, was the continued depression of the barometer over the Norwegian Sea and the North of Europe generally. At first temperature was high for the time of year in all parts of the British Islands; but in England the diurnal range was extremely large—amounting to 30° or upwards between Sunday afternoon and Monday morning—at Loughborough the extreme thermometer readings at 8 a.m. of Monday were: Max. 66°, Min. 33°, range 33°. As the disturbances in the far North drew after them subsidiary depressions across the United Kingdom, temperature gave way and the weather fell into an unsettled, showery, squally condition. On both Thursday and Friday hail, sleet, and snow

occurred in many parts, and electrical phenomena were observed along a track extending from the N. of Ireland across the S. of Scotland to the mouth of the Elbe. On Tuesday night bright aurora borealis had been seen in Scotland and the S. of Ireland. At 8 a.m. of Thursday the barometer stood as low as 28·54 inches at Christiansund on the W. coast of Norway, while it read 30·06 inches at Nice. Needless to say that strong S.W. to N.W. winds and gales swept over Western Europe. In Dublin the mean height of the barometer was 29·842 inches, pressure being observed to range from 29·575 inches at 7·15 a.m. of Thursday (wind, W.N.W.) to 30·386 inches at 9 p.m. of Saturday (wind, E.S.E.). The corrected mean temperature was 44·6°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 43·5°. On Sunday the screened thermometers rose to 55·9°, on Friday they fell to 34·0°. The rainfall measured ·118 inch on four days. The heaviest rainfall in 24 hours was ·058 inch on Saturday. Snow or sleet fell on Thursday and Friday; hail on Thursday. There was a slight fog on Monday night.

Many years have passed since a spell of more beautiful weather than that enjoyed during the week ended Saturday, the 25th, has been recorded in March. After Sunday, which was a cloudy day, very little cloud appeared by day or night, and warm sunny days were followed by calm, sharp nights. Throughout the week, conditions were anticyclonic in Western Europe. The centre of highest atmospherical pressure was generally found over the south of England, France, Belgium, and Holland, and in these regions, under the combined influence of a clear sky and dry air, the diurnal range of temperature was almost phenomenal. For example, at Loughborough, in Leicestershire, on Monday night the screened thermometer sank to 23°, while it rose to 65° in the course of Tuesday—a range of 42° in a few hours. A similar excessive range was observed on Saturday at the same station. In Ireland the extremes of temperature were of the same character, though much less marked. At the very beginning of the week severe frost occurred in Great Britain, the minima in the screen on Sunday being 26° at Leith, Shields, and Dungeness; 25° at York, and in London; 24° at Nairn; 23° at Oxford, and Cambridge; and 20° at Loughborough. The morning of this day in Ireland broke dull and damp, but the weather improved as the day wore on. In Dublin light easterly sea breezes by day alternated with calms by night. The mean height of the barometer was 30·313 inches, pressure ranging from 30·411 inches at 9 a.m. of Sunday (wind, E.S.E.) to 30·193 inches at 9 a.m. of Thursday (wind, calm), and again rising to 30·409 inches at 9 a.m. of Saturday (wind, E.). The corrected mean temperature was 48·2°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 46·2°. On Thursday, the screened thermometers rose to 61·9°; on Tuesday, they fell to 38·3°. There was no measurable rainfall after 9 a.m. of Sunday. Bright sunshine was unusually prevalent and greatly exceeded the mean during this week. At the Ordnance Survey Office, Phœnix Park, the sun shone brightly for 64·2 hours, being 76 per cent. of the possible duration of sunshine. In Guernsey the percentage was 90, in Jersey it was 91. These values in the Channel Islands are higher than any hitherto obtained during any period since the sunshine recorders were established in 1881. In nearly all British and Irish districts the percentages of bright sunshine recorded this week are far higher than any previously observed in the month of March.

The weather was by no means so settled during the closing period (26th–31st inclusive) as it had been during the preceding week. Clouds increased at times, and both atmospherical pressure and temperature became unsteady. Rainfall, however, was again markedly deficient in all parts of the United Kingdom, although in parts of Spain, Portugal, and the extreme south of France there were some heavy downpours—for example, ·67 inch fell at Lisbon on Tuesday, the 28th, and 1·50 inches at Perpignan on Wednesday, the 29th. Until this last-named day an anticyclone stretched northwestwards across the North Sea, while pressure was low and conditions were cyclonic over the Iberian Peninsula. Light to moderate easterly winds prevailed in the British Islands. The first two days of the period were cool and at times cloudy in Dublin. Tuesday proved brilliant, and on Wednesday (with the displacement of the easterly wind by a S.W. and W. current) the thermometer rose in this city to 64·8°. Thursday was cooler. On Good Friday, the 31st, a depression came in from the Atlantic causing squally S.W. winds and a slight rainfall in the evening. The diurnal range of temperature was again excessive at some inland English Stations—thus on Tuesday, the thermometer fell from 67° to 26° at Cambridge and from 64° to 24° at Loughborough. In Dublin the barometer ranged from 30·299 inches at 9 a.m. of Sunday (wind, N.E.) to 29·624 inches at 2 p.m. of Friday (wind, S.W.). On Monday the screened thermometers fell to 37·0°, on Wednesday they rose to 64·8. Rain fell on Friday to the amount of ·022 inch only.

The rainfall in Dublin during the three months ending March 31st has amounted to 5·196 inches on 49 days, compared with 4·808 inches on 48 days in 1892, only 1·650 inches on but 32 days in 1891, 7·470 inches on 45 days in 1890, 5·738 inches on 53 days in 1889, 6·097 inches on 41 days in 1888, and a twenty-five years' average of 6·411 inches on 51·0 days (1865–1889, inclusive).

At Knockdolian, Greystones, Co. Wicklow, only ·205 inch of rain fell on 6 days during March; and the total rainfall since January 1, 1893, equals 7·475 inches on 49 days. The corresponding figures for 1892 are ·995 inch on 9 days, the total rainfall since January 1 being 4·205 inches on 40 days.

The rainfall in March at Cloneevin, Killiney, Co. Dublin, was ·26 inch on 9 days, as against ·98 inch on 10 days in 1892, and an eight years' average of 1·90 inches on 14·5 days. The maximum in the 8 years was 3·59 inches in 1888, the minimum was ·74 inch in 1891.

April.—April proved a fitting sequel to the record-breaking March of 1893. Like its predecessor, the month was characterised by drought, bright sunshine, and a high temperature. The mean amount of cloud was only 40 per cent., falling at 9 p.m. to 33·3 per cent. So powerful was the heating power of the sun by day that, notwithstanding free radiation by night, the thermometer did

not fall below 36·2° in the screen, and 28·9° on the grass in the city of Dublin. The drought was happily interrupted in Ireland by copious falls of rain on the 16th and 17th, and again on the 29th and 30th.

In the matter of temperature, however, April, 1893, breaks the record, the mean being 3·7° above average, and also 1·0° above the mean of the Aprils of 1865 and 1874, which had been the warmest since the present records began up to 1893. Unwonted drought held throughout the month in south-eastern England, the rainfall in London, for example, being only one-tenth of an inch on only 4 days.

In Dublin the arithmetical mean temperature (51·4°) was 3·7° above the average (47·7°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 50·3°. In the twenty-eight years ending with 1892, April was coldest in 1879 (the cold year), (M. T.=44·5°), and warmest in 1865 and 1874 (M. T.=50·4°). In 1886, the M. T. was 46·3°, in 1887 it was as low as 45·1°, in 1888 it was (as also in 1891) only 45·7°, in 1889, 46·1°; in 1890, 47·3°; and in 1892, 46·2°. The month now under discussion thus proves to have been the warmest April for at least 30 years.

The mean height of the barometer was 30·171 inches, or 0·321 inch above the average value for April—namely, 29·850 inches. The mercury was as high as 30·575 inches at 9 a.m. of the 8th, and fell to 29·793 inches at 4 p.m. of the 19th. The observed range of atmospherical pressure was, therefore, 0·782 inch—that is, a little more than three-quarters of an inch.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 50·3°, or 3·8° above the value for March, 1893. Using the formula, *Mean Temp.* =*min.* + (*max.*—*min.* × ·476), the value becomes 51·1°, or 3·7° above the average mean temperature for April, calculated in the same way, in the twenty-five years, 1865–89, inclusive (47·4°). The arithmetical mean of the maximal and minimal readings was 51·4°, compared with a twenty-five years' (1865–1889 inclusive) average of 47·7°. On the 22nd, the thermometer in the screen rose to 66·8°—wind, S.E.; on the 14th the temperature fell to 36·2°—wind, W.S.W. The minimum on the grass was 28·9°, also on the 14th.

The rainfall was only 1·046 inches, distributed over 7 days. The average rainfall for April in the twenty-five years, 1865–89, inclusive, was 2·055 inches, and the average number of rainy days was 15·2. The rainfall, therefore, was considerably below the average, while the rainy days were also very deficient. In 1877 the rainfall in April was very large—4·707 inches on 21 days; in 1882 also 3·526 inches fell on 20 days. On the other hand, in 1873, only ·498 of an inch was measured on 8 days; and in 1870 only ·838 of an inch fell, also on 8 days. The fall in 1890 was 1·575 inches on 14 days, in 1891, 1·553 inches fell on 14 days, and in 1892, 1·114 inches on 13 days.

There was a lunar halo on the 26th. The atmosphere was more or less foggy on the 6th and 17th. High winds were noted on only 4 days, and did not reach the force of a gale on any occasion. No snow or sleet was seen, but hail fell on the 29th. The temperature exceeded 50° in the screen on every day compared with only 24 days in April, 1892, and 18 days in April, 1891. It rose above 60° on 11 days, but never fell to 32° in the screen. The minimum on the grass was 32°, or less, on 5 nights, compared with 12 nights in March, 13 in February, and 16 in January. The mean lowest temperature on the grass was 38·2°, compared with 32·4° in 1892, 34·1° in 1891 and 1890, 34·4° in 1889, 34·6° in 1888, and 31·6° in 1887.

The first day of the month was cloudy and cool, but dry.

The drought, which set in at the beginning of March, continued through the week ended Saturday, the 8th. Temperature showed a decided tendency to fall, particularly on the eastern coasts of both Ireland and Great Britain, in which parts much sea-fog was prevalent. At the beginning of the week an anticyclone lay over Ireland and England, while an extensive and deep depression, with central barometrical readings below 28·90 inches, swept eastwards across the extreme North of Europe. Beautiful, bright weather prevailed, except in the far north, where clouds gathered and rain fell. Shallow depressions formed over the S.W. of Europe on and after Tuesday, so that a decided easterly air-current set in and fogs and low temperatures prevailed on the east coasts of the British Isles, while bright sunshine and warmth held inland. The most striking example of these conditions was presented on Thursday, when the thermometer rose to 63° at Loughborough, Oxford, and Cambridge—all inland stations, whereas the maximum was only 44° at Yarmouth and 42° at Spurn Head. On Friday the maximum was 68° in London, but only 42° at Shields and Spurn Head. After Thursday a new and much larger anticyclone formed in the N.W. and N., causing N.E. winds, clouds, and low temperatures on Friday and Saturday. In Dublin the mean pressure was 30·302 inches, the barometer falling to 30·051 inches at 6·30 p.m. of Wednesday (wind, E.), and rising to 30·575 inches, at 9 a.m. of Saturday (wind, N.E.). The corrected mean temperature was 48·5°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 48·0°. On Sunday the screened thermometers fell to 36·5°, on Wednesday they rose to 61·4°. A very slight shower fell at 5 p.m. of Thursday, but yielded no measurable rainfall. The prevailing wind was easterly.

With the exception of a general decrease of temperature, the weather of the week ended Saturday, the 15th, resembled that of its immediate predecessors, being singularly fine, dry, and quiet. Anticyclonic areas were found lying over one or another portion of the British Islands on every day of the week. At the same time shallow atmospherical depressions lay over southern Europe and the Mediterranean Basin, producing easterly winds and lower temperature in England and Ireland; while deeper cyclonic systems passed eastwards or south-eastwards across northern Europe, where frost and snow resumed their sway as the week advanced. Towards the close of the period the anticyclone began to move southwards, its centre on Thursday lying over the South of Scotland, on Friday over the midland counties of England, and on Saturday over the east of France. Sharp night frosts were felt at many stations during the week—the sharpest of all occurred on Thursday night, when the thermometer fell to 24° in the screen at Loughborough and Cambridge, and to

27° at Oxford. In Dublin, Sunday, Tuesday, and Thursday were rather cloudy and very cool. Wednesday, also, was cold, but the air was dry and bright sunshine prevailed. In this city the mean height of the barometer was 30·331 inches, pressure ranging from 30·479 inches at 9 a.m. of Wednesday (wind, E.N.E.), to 30·103 inches at 9 p.m. of Saturday (wind, W. by S.). The corrected mean temperature was 47·6°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 47·0°. On Friday, the screened thermometers fell to 36·2°, on Saturday they rose to 60·6°. There was no rainfall until the early morning of Sunday, the 16th, when two-thousandths of an inch (·002) fell. The prevailing winds were, at first, E.N.E., afterwards W. and W.S.W.

While the general character of the weather during the week ended Saturday, the 22nd, was favourable, conditions were less stable than of late, and at the beginning of the week a grateful and copious rainfall in Ireland and Scotland gave a marvellous impetus to vegetation. On Sunday morning a shallow depression was found off the N.W. of Ireland, and a much deeper depression—with central readings of the barometer as low as 28·75 inches at Haparanda on the Gulf of Bothnia—was travelling eastwards across Lapland. In the course of the day rain fell in abundance at most Irish and several British stations, the downpour being renewed on Monday evening. At this time a well-defined anticyclone lay over the North Sea, influencing the English stations and causing finer and cooler weather. On Thursday morning the distribution of atmospherical pressure was very irregular, and several local and shallow depressions caused thunder showers in parts of Great Britain. Temperature had previously risen to an unusual height for the time of year at inland stations—to 68° at Parsonstown, 72° at Holyhead, 75° in London and at Oxford, 76° at Loughborough, and 78° at Cambridge on Wednesday. In Dublin the maximum next day (Thursday) was 66·6°, but in London it was 82° and at Cambridge 84°. Friday was very fine, but at night thunderstorms occurred at Roche's Point and Scilly. Saturday proved very warm but changeable in Ireland. In Dublin the mean height of the barometer was 30·014 inches, pressure varying between 30·151 inches at 9 p.m. of Thursday (wind, N.) and 29·793 inches at 4 p.m. of Wednesday (wind, E.S.E.). The corrected mean temperature was 55·3°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 54·5°. On Friday the minimal temperature was 46·0°, on Saturday the maximum was 66·8°. Rain fell on five days to the total amount of ·762 inch, ·370 inch being measured on Monday. The prevalent winds were first S.W., afterwards E.S.E.

The record is once more one of most favourable weather during the week ended Saturday, the 29th. Bright, sunny, warm days were followed by quiet, clear, cool nights until Saturday, when copious showers fell at intervals, refreshing the face of nature and aiding vegetation. Areas of relatively high atmospherical pressure (anti-cyclonic systems) were found lying over the greater part of the British Islands until Saturday, when an extensive and definite depression travelled eastwards across the northern half of the United Kingdom, causing squally W. to N.W. winds and the grateful showers already mentioned. Throughout the week the barometer was comparatively low over the Iberian Peninsula, the Bay of Biscay, and France. Except at Lisbon, however, where 3·40 inches of rain fell on five days up to Friday morning, the weather was at first generally dry within the area of low pressure. On Thursday there was a downpour all over the south of France, ·83 inch being measured at Nice, ·87 inch at Biarritz, and 1·34 inches at Perpignan on Friday morning. Thunderstorms occurred at Prawle Point during the night of the 22nd-23rd, and at Holyhead on Monday night. In Dublin the mean height of the barometer was 30·067 inches, pressure varying from 30·137 inches at 9 a.m. of Monday (wind, N.) to 29·887 inches at 3 p.m. of Saturday (wind, W.N.W.). The corrected mean temperature was 53·8°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 52·5°. On Tuesday temperature rose to 65·7° in the shade; on Saturday it fell to 43·9°. Rain and hail fell on Saturday in heavy showers to the amount of ·150 inch. The prevailing winds were N. and N.W.

Sunday, the 30th, was changeable, but favourable.

The rainfall in Dublin during the four months ending April 30th amounted to 6·242 inches on 56 days, compared with 5·922 inches on 61 days during the same period in 1892, only 3·203 inches on 46 days in 1891, 9·045 inches on 59 days in 1890, 8·345 inches on 74 days in 1889, 8·090 inches on 58 days in 1888, and a twenty-five years' average of 8·466 inches on 66·2 days.

At Knockdolian, Greystones, Co. Wicklow, the rainfall during April, 1893, amounted to only 1·055 inches, distributed over only 5 days—·720 inch falling on the 16th. The total fall since January 1st, 1893, equalled 8·530 inches on 54 days.

The rainfall in April at Cloneevin, Killiney, Co. Dublin, was 1·15 inches on 6 days, as against an eight-years' average of 1·56 inches on 13·0 days. The maximal fall in 24 hours was ·63 inch on the 16th.

May.—Like March and April of the present year, this month was singularly fine—warm and for the most part dry. Unlike March and April, however, the amount of cloud was considerable—62·3 per cent. compared with only 49·1 per cent. in March, and only 40·0 per cent. in April. Nor was the drought at all as severe as in the two previous months. In Dublin rain fell abundantly at the beginning and in the middle of the month, the total fall being 1·666 inches, against only ·288 inch in March and 1·046 inches in April. As regards temperature, this was a "record month," the mean being 0·9° above that for May, 1868—namely, 56·7° against 55·8°.

In Dublin the arithmetical mean temperature (56·7°) was decidedly above the average (52·0°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 55·3°. In the twenty-eight years ending with 1892, May was coldest in 1869 (M. T. = 48·2°), in 1885 (M. T. = 48·7°), and in 1879 (the "cold year") (M. T. = 48·8°). It was warmest in 1868 (the "warm year") (M. T. = 55·8°), and 1875 (M. T. = 54·9°). In 1886 the M. T. was 50·5°; in 1887, 51·8°; in 1888, 52·5°; in 1889, 54·6°; in 1890, 53·2°; in 1891, only 49·6°; and in 1892, 53·8°.

The mean height of the barometer was 30·038 inches, or 0·049 inch above the corrected average

value for May—namely, 29·989 inches. The mercury rose to 30·455 inches at 9 a.m. of the 10th, and fell to 29·407 inches at 4 p.m. of the 19th. The observed range of atmospherical pressure was, therefore, 1·048 inches.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 55·3°, or 5·0° above the value for April, 1893. Using the formula, *Mean Temp.* = *Min.* + (*max.—min.* × ·47), the value was 56·3°, or 4·7° above the average mean temperature for May, calculated in the same way, in the twenty-five years, 1865–89, inclusive (51·6°). The arithmetical mean of the maximal and minimal readings was 56·7°, compared with a twenty-five years' average of 52·0°. On the 11th the thermometer in the screen rose to 70·2°—wind, W.N.W.; on the 31st the temperature fell to 42·8°—wind, N.N.E. The minimum on the grass was 38·8°, also on the 31st.

The rainfall amounted to 1·666 inches, distributed over 10 days. The average rainfall for May in the twenty-five years, 1865–89, inclusive, was 2·030 inches, and the average number of rainy days was 15·4. The rainfall and the rainy days, therefore, were much below the average. In 1886 the rainfall in May was very large—5·472 inches on 21 days; in 1869 also 5·414 inches fell on 19 days. On the other hand, in 1871, only ·378 of an inch was measured on 9 days; in 1876 only ·798 of an inch fell on 6 days; in 1887 only ·882 of an inch on 10 days; and in 1888 only ·978 of an inch on 11 days. In 1890, 2·438 inches fell on 17 days. In 1891 May was the first month in which the rainfall exceeded the average. It amounted to 2·792 inches on 17 days. In 1892 the large amount of 4·177 inches fell on 19 days.

Solar halos were seen on the 6th and 10th. High winds were noted on only 4 days, never attaining the force of a gale. Thunder was heard on the 15th, 20th, and 29th. No hail, sleet, or snow fell.

During the month the thermometer did not fall below 32°, either in the screen or on the grass. The mean minimal temperature on the grass was 45·6°, compared with 41·3° in May, 1892, 37·7° in 1891, 42·2° in 1890, 42·4° in 1889, 37·5° in 1888, and 37·9° in 1887.

During the period ended Saturday, the 6th, the weather was most favourable. Rain fell in copious showers on Monday and Tuesday, the 1st and 2nd, after which came a succession of fine, dry days, with intervals of hot sunshine. On Sunday, April 30th, a "hollow" of low atmospherical pressure stretched south-eastwards from Iceland to Denmark, so that N.W. winds, low temperatures, and changeable showery weather were experienced in the British Islands. During the next two days the barometer was unsteady, especially over Ireland and Scotland, in which countries rain fell pretty freely. In the South of England and the neighbourhood of London, however, the drought continued almost uninterruptedly. On Thursday a large anticyclone began to form over Norway, the North Sea, and Great Britain, and the weather became once more finer, brighter, and warmer. Over Ireland much cirriform cloud was at this time daily observed travelling in an upper air-current from S.W., while the surface wind was S.E. or E. In Dublin the air-pressure ranged from 29·778 inches, at 4 p.m. of Tuesday (wind, S.W.) to 30·284 inches at 9 a.m. of Saturday (wind, E.S.E.). On Monday the shade minimum was 46·1°, on Friday the shade maximum was 68·7°. Rain fell on the first two days to the amount of ·402 inch, ·323 inch being measured on Monday, the 1st. The prevalent winds were first westerly, then east-south-easterly. A solar halo was seen on Saturday forenoon.

The weather was exceedingly fine and dry throughout the week ended Saturday, the 13th—at least in England and Ireland—in Scotland refreshing rains fell on Wednesday and the two following days. At the beginning of the period a vast anticyclone stretched south-westwards from Sweden, where the barometer stood above 30·9 inches (30·95 inches at Hernösand at 8 a.m. of Sunday), across the North Sea to the British Isles. The wind was rather squally from E. and S.E. and temperature was low—night frosts occurring in parts of England as well as on the Continent. By Wednesday a great change was in progress—the barometer was falling in the N. and rising in the S., while a tongue of high pressure still stretched across England and Ireland. The change was attended by a copious rainfall in many parts of France on Tuesday; and was followed by the setting in of westerly winds over the northern half of the British Isles, where also clouds increased and rain fell as above mentioned. After a sharp night on Wednesday, temperature rose considerably in England on Thursday, when also the thermometer exceeded 70° in the shade in Dublin for the first time this season. Friday was at first cloudy, but afterwards fair; and Saturday proved a brilliant summerlike day. In Dublin the mean height of the barometer was 30·317 inches, pressure ranging from 30·455 inches at 9 a.m. of Wednesday (wind, E.N.E.) to 30·070 inches at 9 p.m. of Saturday (wind, calm). The corrected mean temperature was 55·9°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 55·5°. On Thursday the thermometer rose to 70·2° in the shade, having fallen to 47·1° on Wednesday. There was no rainfall. The prevailing winds were E. and W.N.W.

The week ended Saturday, the 20th, may be said to have witnessed the break-up of the drought, which—with slight and transitory interruptions—had held in Western Europe since the end of February. At the beginning the barometer was falling over England, Ireland, and the West of France, as a large, but not deep, depression formed over the Bay of Biscay and the Atlantic off our S.W. coasts. On Sunday the weather remained dry in most places, but much lofty cirriform stratus cloud came up from the southward, causing the sky to assume an unsettled, thundery appearance. On Monday thunder storms occurred in the West of England and in Wales, and from that time onwards to the close of the week thunder and lightning were daily reported from one part or another of the British Islands. Some very heavy rainfalls occurred—for example, 1·05 inches at Roche's Point on Tuesday, 1·60 inches at Loughborough on Wednesday, ·71 inch at Parsonstown on Friday, and ·72 inch in the City of Dublin on Saturday. On this day 1·030 inches of rain fell at the Ordnance Survey Office, Phœnix Park, and 1·020 inches at the Botanic Gardens, Glasnevin. As temperature remained fairly high throughout, the beneficial effects of the rainfall on vegetation became instantly apparent. In Dublin the mean height of the barometer was 29·634 inches, or as much as ·683 inch

below the mean for the preceding week. The barometer read 30·010 inches at 9 a.m. of Sunday (wind, E.S.E.), and fell to 29·407 inches at 4 p.m. of Friday (wind, E.S.E.). The corrected mean temperature was 57·4°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 55·4°. On Sunday the screened thermometers rose to 65·7°, on Saturday they fell to 48·2°. Distant thunder was heard on Monday and Saturday. Rain fell on three days to the amount of ·947 inch, ·720 inch being measured on Saturday. The prevailing winds were E. and S.E.

Changeable, but favourable weather prevailed during the week ended Saturday, the 27th. At first showery, it afterwards became dry and fine, although the amount of cloud remained considerable to the end. The period began with a high pressure system lying over the Baltic and Scandinavia, and depressions to the westward and northwestward of the British Islands. As the week advanced these conditions became reversed—the depressions travelled northeastward, and a new area of high pressure (anticyclone) came in over Ireland from the Atlantic. At the close of the period a low pressure system was found over the Baltic and Sweden, while the anticyclone remained almost stationary over, and off the west coast of Ireland. In Dublin Sunday forenoon was rainy; light showers fell in the afternoon, but the evening proved fair. Monday was cloudy but fine. Tuesday was cloudy, showery, and squally. Some rain fell on Wednesday morning, after which the weather remained chiefly dry, but very cloudy to the close of the week. The mean height of the barometer in Dublin was 30·014 inches, pressure ranging from 29·543 inches at 9 a.m. of Sunday (wind, W.) to 30·337 inches at 9 p.m. of Friday (wind, N.N.W.). The corrected mean temperature was 56·6°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 55·7°. On Sunday the screened thermometers fell to 46·9°; on Saturday they rose to 64·8°. Rain was measured on four days, the total amount being ·137 inch, of which ·059 inch fell on Sunday. The prevalent wind was first westerly, then northerly.

During the last four days the weather, which was chiefly fine but changeable, was governed by a depression over the south of Sweden and an anticyclone to the westward of Scotland. North-easterly winds prevailed, and a tendency to electrical disturbances existed on Sunday and Monday, the 28th and 29th. On the afternoon of the latter day thunder and heavy rain occurred in both London and Dublin. The weather on the 30th and 31st was bright and bracing—hot sunshine and a cold N.E. wind asserting themselves with alternate power.

The rainfall in Dublin during the five months ending May 31st amounted to 7·908 inches on 66 days, compared with 19·099 inches on 80 days in 1892, only 5·995 inches on 63 days in 1891, 11·483 inches on 76 days in 1890, 10·476 inches on 91 days in 1889, 9·068 inches on 69 days in 1888, 6·489 inches on 62 days in 1887, and a 25 years' average of 10·496 inches on 81·6 days.

It may be remembered that on Saturday, May 28th, 1892, 2·056 inches of rain were measured at this station, 1·900 inches having fallen within 6 hours, or at the rate of 7·6 inches in 24 hours. No such measurement had been recorded in Dublin since October 27, 1880, when 2·736 inches of rain fell. May 28, 1892, was only the third occasion within the past twenty-eight years on which the rainfall exceeded 2 inches within 24 hours in Dublin.

At Knockdolian, Greystones, Co. Wicklow, the rainfall in May, 1893, was 1·035 inches, distributed over 11 days. Of this quantity ·310 inch fell on the 16th, and ·200 inch on the 29th. The total fall since January 1st, 1893, equals 19·565 inches on 65 days.

At Cloneevin, Killiney, Co. Dublin, the rainfall in May was 1·12 inches on 10 days, compared with an eight years' average of 2·49 inches on 15·5 days. The total fall since January 1 at this station has been 8·06 inches on 67 days. The maximal fall on any one day in May was ·40 inch on the 20th.

June.—June, 1893, was the fourth month in succession with a mean temperature above average and a rainfall below average. The month under review did not—it is true—"break the record" as regards either high temperature or scanty rainfall; but it was in all respects most favourable. In Dublin rain fell freely from the 3rd to the 6th inclusive (·521 inch) and again from the 22nd to the 28th inclusive (1·144 inches), but the weather was otherwise dry, except for local thunder-showers on the 15th.

In Dublin the arithmetical mean temperature (59·9°) was above the average (57·8°) by 2·1°; the mean dry bulb readings at 9 a.m. and 9 p.m. were also 59·9°. In the twenty-eight years ending with 1892, June was coldest in 1882 (M. T.=55·8°), and in 1879 (the "cold year") (M. T.=55·9°). It was warmest in 1887 (M. T.=62·3°), in 1865 (M. T.=61·0°), and in 1868 (the "warm year") (M. T.=60·5°). In 1886 the M. T. was 57·5°; in 1888, 56·2°; in 1889, 59·5°; in 1890, 58·1°; in 1891, 59·0°; and in 1892, 56·7°.

The mean height of the barometer was 30·002 inches, or 0·085 inch above the corrected average value for June—namely, 29·917 inches. The mercury rose to 30·398 inches at 9 a.m. of the 7th, and fell to 29·320 inches at 11 p.m. of the 27th. The observed range of atmospherical pressure was, therefore, 1·078 inches—that is, less than an inch and one-tenth.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 59·9°, or 4·6° above the value for May, 1893. Using the formula, *Mean Temp.=Min.+(max.−Min.* × ·465), the value was 59·4°, or 2·2° above the average mean temperature for June, calculated in the same way, in the twenty-five years, 1865–89, inclusive (57·2°). The arithmetical mean of the maximal and minimal readings was 59·9°, compared with a twenty-five years' average of 57·8°. On the 19th the thermometer in the screen rose to 74·7°—wind, N.N.E.; on the 23rd the temperature fell to 46·9°—wind, N.N.W. The minimum on the grass was 42·8° also on the 23rd.

The rainfall amounted to 1·716 inches, distributed over 12 days. The average rainfall for June in the twenty-five years, 1865–89, inclusive, was 1·817 inches, and the average number of rainy days was 13·8. The rainfall was, therefore, slightly below, while the rainy days were also below the average. In 1878 the rainfall in June was very large—5·058 inches on 19 days; in 1879 also

4·046 inches fell on 24 days. On the other hand, in 1889, only ·100 of an inch was measured on 6 days; in 1887, the rainfall was only ·252 of an inch, distributed over only 5 days; in 1874 only ·405 of an inch was measured on 9 days; and in 1868 only ·677 of an inch fell on but 6 days. In 1888 the rainfall was as much as 3·045 inches, distributed over as many as 18 days. In 1890 it was 1·930 inches on 18 days, in 1891 2·753 inches on 14 days, and in 1892 1·671 inches on 17 days.

High winds were noted on 7 days, but the force of a gale was attained on only one occasion—the 28th. Temperature reached or exceeded 70° in the screen on 5 days, compared with 17 days in 1887, only 1 day in 1888, 10 days in 1889, only 2 days in 1890, 6 days in 1891, and 4 days in 1892. Thunder was heard on the 15th. A solar halo was seen on the 11th.

On Thursday, the 1st, a depression which had for several days lain almost motionless over the south of Sweden dispersed, and an irregular area of low pressure began to form over Ireland. The weather, however, remained dry until Saturday, the 3rd, when electrical showers fell heavily in places, particularly at Blackrock, Co. Dublin. Thunder was heard on this day at Glasnevin Botanic Gardens.

At the beginning of the week ended Saturday, the 10th, the weather was unsettled and showery, owing to the presence of shallow irregular depressions to the northward, while an anticyclone lay over the Bay of Biscay. In Dublin rain fell very freely on Monday and in smaller quantity on Tuesday. On Sunday thunderstorms occurred all along the east coast of Great Britain. During most of this changeable time the barometer rose steadily, so that by 8 a.m. of Wednesday readings were everywhere high and remarkably uniform. In fact, at the hour named, the extreme difference in atmospherical pressure all over the United Kingdom was only ·08 inch—the highest reading being 30·42 inches at Yarmouth, and the lowest 30·34 inches in the Scilly Islands. After Wednesday the anticyclone held to the close of the week, the area of highest pressure being found off the east coast of Scotland, where dense fogs and low temperature prevailed. In most other parts of the Kingdom summer warmth daily increased until Saturday—the thermometer rising to 79° at Loughborough on Wednesday, 76° at Liverpool on Thursday, and 74° at Parsonstown and in London on Friday. On the evening of this day a thunderstorm with heavy rain (1·19 inches) occurred at Parsonstown. In Dublin the mean height of the barometer was 30·313 inches, pressure ranging from 30·105 inches at 9 a.m. of Sunday (wind, W. by S.) and 30·398 inches at 9 a.m. of Wednesday (wind, N.E.). The corrected mean temperature was 58·9°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 59·2°. On Thursday both maximal and minimal temperatures for the week were recorded—viz., 69·6° and 49·5°—range, 20·1°. Rain fell on the first three days to the amount of ·512 inch, ·259 inch being registered on Sunday and ·201 inch on Monday. The prevailing winds were at first W.S.W., afterwards E. Much fog and haze prevailed in the Irish Sea after Wednesday, so that the fog-gun at the Kish-bank lightship was frequently fired both by day and by night.

Splendid weather characterised the week ended Saturday, the 17th. Until Wednesday it was cool as well as fair, but on and after that day temperature was high and summerlike by night as well as by day. On Sunday local thunderstorms occurred in the N. and N.W. of Ireland, notwithstanding an anticyclonic distribution of atmospheric pressure. After Sunday a shallow depression advanced northwards across France. It caused thunderstorms and heavy rains over the greater part of that country, but in the British Isles only local thundershowers occurred, although thunder and lightning were very prevalent on Wednesday and Thursday. On the afternoon of the latter day thundershowers fell in Dublin, yielding ·051 inch of rain, the only rainfall of the week. In this city the influence of easterly seabreezes in lowering day-temperature was well seen, particularly in the earlier part of the period—thus, the maxima of the first four days were 66°, 65°, 65°, and 67° in Dublin, compared with 75°, 70°, 71°, and 75° at Parsonstown. On the east coast of Great Britain, similarly, the thermometer failed to reach 60° at most stations on Sunday and Monday. In Dublin the mean height of the barometer was 30·104 inches, pressure decreasing from 30·229 inches at 9 a.m. of Sunday (wind, E.N.E.) to 29·883 inches at 9 a.m. of Wednesday (wind, E.), and then increasing to a maximum of 30·373 inches at 9 p.m. of Saturday (wind, E.). The corrected mean temperature was 61·8°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 62·9°. On Tuesday the screened thermometers fell to 50·1°, on Saturday they rose to 72·9°. The mean direction of the wind was easterly.

As to the week ended Saturday, the 24th—at first summerlike in the extreme—very warm, calm and bright—the weather afterwards fell into a very unsettled state, becoming cold, squally, and showery after Wednesday, the 21st—the longest day. On Sunday, the anticyclonic isobar of 30·3 inches embraced nearly the whole of the British Islands—at 8 a.m. the extreme pressures at mainland stations differed by only *one-tenth* of an inch, the highest readings being 30·38 inches at Loughborough, Cambridge, Malin Head, and Belmullet; the lowest being 30·28 inches at Prawle Point in Devon. The weather was bright, calm, and hot—the thermometer rising to 86° in the shade at Cambridge and Loughborough, and to 80° even at Parsonstown and Valentia Island. In the evening a thunderstorm occurred at the last-named station. On Monday the heat was still more intense—88° in the shade being recorded in London and at Cambridge. Thunderstorms occurred towards evening in the South of Ireland, South Wales, and the eastern and south-eastern parts of England. After this a cold northerly current passed rapidly southwards, bringing heavy showers which became general during the last three days. On Thursday a depression formed over Scotland and moved slowly south-eastwards and finally eastwards, becoming deeper and larger as it travelled. At 8 a.m. of Friday the barometer was down to 29·24 inches at Shields, and below 29·30 inches all over the north of England and south of Scotland. In Dublin the mean pressure was 29·846 inches, the barometer falling from 30·360 inches at 9 a.m. of Sunday (wind, E.), to 29·467 inches at 9 a.m. of Friday (wind, N. by W.). The corrected mean temperature was 59·0°—that for Sunday and Monday having been 65·8°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 58·7°. On

Monday the thermometers in the screen rose to 74·7°; on Friday they fell to 46·9°. Rain fell on the last three days to the amount of ·310 inch, ·130 inch being measured on Thursday and ·100 inch on Saturday. The prevalent wind was northerly—N.N.E. to N.W.

During the closing period of the month—from the 25th to the 30th inclusive—the weather presented two distinct types. Unsettled, squally, and showery as well as cool at first, it improved after Wednesday, the 28th, and the month closed with fine, warm, and in all respects summerlike conditions. On Sunday, the 25th, the well-defined depression, which had travelled from Scotland in a south-easterly direction on the previous Friday (see above), lay with its centre over the south of Norway. N.W. winds and cool, showery weather prevailed in the British Islands. In Dublin heavy showers fell locally at 3.30 and 11 p.m. Next day (Monday) an irregularly-shaped depression passed northwards across Ireland, causing a heavy rainfall in the south of this country (1·10 inches at Roche's Point, Cork), and in Wales and parts of England. During Tuesday and Wednesday a well-marked cyclonic system travelled north-eastwards from the N. of Ireland and across Scotland to the Norwegian Sea, where it dispersed. This disturbance produced moderate to fresh S.W. and W. gales at some Irish stations, as well as in the English Channel and off the mouth of the Thames. The barometer now rose quickly, and at 8 a.m. of Friday, the 30th, atmospherical pressure was uniformly high all over the kingdom—pressure ranging only from 30·20 inches over Central England to 30·05 inches at Belmullet. Quiet, bright, summerlike weather was the consequence, and so the month closed. In Dublin, during this period, the barometer ranged from 29·320 inches at 11 p.m. of Tuesday (wind, S.S.W.) to 30·142 inches at 9 a.m. of Friday (wind, S.E.). As regards temperature, on Monday and Friday the minimum in the thermometer screen was 50·0°; on Tuesday the maximum was 69·4°. Rain fell on the first four days of the period to the amount of ·834 inch, ·492 inch being registered on Monday. This was the maximal fall in 24 hours recorded during the month. The prevailing winds were S.E. and S.W.

The rainfall in Dublin during the six months ending June 30th amounted to 9·624 inches on 78 days, compared with 11·770 inches on 97 days in 1892, 8·748 inches on 77 days in 1891, 13·413 inches on 94 days in 1890, 10·576 inches on 97 days in 1889, 12·113 inches on 87 days in 1888, 6·741 inches on 67 days in 1887, and a twenty-five years' average of 12·313 inches on 95·4 days.

At Knockdolian, Greystones, Co. Wicklow, the rainfall in June, 1893, was 2·211 inches, distributed over 10 days. Of this quantity ·750 inch fell on the 26th, and ·410 inch on the 5th. The total fall since January 1 has been 11·776 inches, on 75 days.

The rainfall at Cloneevin, Killiney, Co. Dublin, amounted to 1·63 inches on 10 days. The greatest fall in 24 hours was ·61 inch on the 26th. The average rainfall for June in eight years was 1·42 inches on 11·5 days. There was absolute drought from the 7th to the 21st, both days inclusive. Since January 1, 1893, 9·69 inches of rain have fallen on 77 days, the average rainfall for the six months ending June 30 having been in eight years 10·66 inches on 82 days.

July.—A changeable, rather showery, but warm month, of high mean temperature and almost average rainfall, with a decided prevalence of north-easterly and north-westerly winds.

In Dublin the arithmetical mean temperature (61·6°) was decidedly above the average (60·6°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 60·5°. In the twenty-eight years ending with 1892, July was coldest in 1879 (the "cold year") (M. T. = 57·2°). It was warmest in 1887 (M. T. = 63·7°), and in 1868 (the "warm year") (M. T. = 63·5°). In 1886 the M. T. was 61·0°; in 1888 it was as low as 57·3°; in 1889 it was 58·7°; in 1890, 58·1°; in 1891, 59·0°; and in 1892, 57·8°. From this, July, 1887, proves to have been the warmest since the present records commenced, whilst July, 1879, was the coldest. In only 2 years since 1864 was July colder than in the year 1892.

The mean height of the barometer was 29·896 inches, or ·019 inch below the corrected average value for July—namely, 29·915 inches. The mercury marked 30·234 inches at 9 p.m. of the 27th, and fell to 29·429 inches at 7 15 p.m. of the 19th. The observed range of atmospherical pressure was, therefore, 0·805 inch—that is, a little more than eight-tenths of an inch.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 60·5°, or 0·6° above the value for June, 1893. Using the formula, *Mean Temp. = min. + (max.—min.* × ·465), the value was 61·1°, or 0·9° above the average mean temperature for July, calculated in the same way, in the twenty-five years, 1865–89, inclusive (60·2°). The arithmetical mean of the maximal and minimal readings was 61·6°, compared with a twenty-five years' average of 60·6°. On the 23rd, the thermometer in the screen rose to 74·5°—wind, S.W.; on the 22nd the temperature fell to 50·0°—wind, W.N.W. The minimum on the grass was 44·8° on the 21st and again on the 22nd.

The rainfall was 2·042 inches, distributed over 14 days. The average rainfall for July in the twenty-five years, 1865–89, inclusive, was 2·420 inches, and the average number of rainy days was 17·2. The rainfall, therefore, was considerably below the average, while the rainy days were also below it. In 1880 the rainfall in July was very large—6·087 inches on 24 days; in 1871 also 4·391 inches fell on 28 days. On the other hand, in 1870, only ·539 of an inch was measured on 8 days; in 1869, the fall was only ·739 of an inch on 9 days, and in 1868, only ·741 of an inch fell on but 5 days. In 1892, 1·952 inches fell on 12 days.

High winds were noted on 9 days, but did not attain the force of a gale on any occasion. Temperature reached or exceeded 70° in the screen on 8 days. In July, 1887, temperature reached or exceeded 70° in the screen on no fewer than 17 days. In July, 1888, the maximum was only 68·7°. In July, 1891, maxima of 70° were reached on only 3 days, and in July, 1892, on only 2 days. Severe thunderstorms occurred on the 12th, and distant thunder was heard on the 13th.

Saturday, the 1st, was very fine and warm, with beautiful cirro-cumuli travelling from S.

Warm and generally favourable weather held during the week ended Saturday, the 8th. In parts of England severe thunderstorms and heavy rains were felt in the beginning—on Sunday and Monday in the N. and N.E. as well as in the North Midland Counties; on Tuesday, in the S.W. and S. of that country and in the English Channel. On Saturday electrical disturbances were again

prevalent. On Monday the rainfall was 1·38 inches at York and 1·8 inches at Stoke-on-Trent; on Tuesday 2·05 inches of rain fell at Prawle Point in Devonshire, 1·15 inches at Jersey, ·91 inch at Hurst Castle, in Hants, and ·57 inch at Dungeness in Kent. The distribution of atmospherical pressure was irregular and shifting until Thursday, when the barometer began to give way steadily in the west, and freshening S.E. and S. winds sprang up on the Irish coasts, with heavy rain at Valentia Island (·68 inch at 8 a.m. of Friday). The heat in England was very great on Sunday, when the thermometer rose to 83° at Oxford, 84° in London and at Loughborough, and 85° at Cambridge; and also on Thursday, when the maxima were 81° at Loughborough, 83° at Oxford, 84° in London, and 86° at Cambridge. On Friday the thermometer rose to 90° at Cambridge, 88° at Loughborough, and 87° in London. At 8 a.m. of Saturday, temperature was 80° in London and 79° at Cambridge, and the thermometer subsequently rose to 87° in London, 92° at Cambridge, and 96° locally at Elsing in Norfolk. In Ireland the highest readings were about 12° to 15° lower—75° being touched at Belmullet, Co. Mayo, on Wednesday. In Dublin the maximum exceeded 70° on five days, the highest reading of all being 71·8° on Monday and Saturday. The minimum in the screen was 54·2° on Thursday. The mean height of the barometer was 29·960 inches, pressure falling from 30·201 inches at 9 a.m. of Monday (wind, N.E.) to 29·591 inches at 9 p.m. of Saturday (wind, S.E.). The corrected mean temperature was 63·2°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 62·8°. The rainfall ·187 inch on one day—·184 inch of the amount fell on the morning of Sunday, July 9. The prevailing winds were first N.E., afterwards S.E.

Very unsettled, rainy, thundery weather held during the greater part of the week ended Saturday, the 15th, and temperature showed a decided falling off compared with the previous sennight. At 8 a.m. of Sunday a depression lay over the British Islands, its centre stretching from Ulster to the Lowlands of Scotland. It caused heavy rains in many places—2·81 inches being measured at Malin Head on Monday morning. In Dublin rain fell in torrents from 11 to 11.30 a.m. of Sunday, and on this day as well as on Monday thunderstorms occurred over the greater part of England. On Tuesday a new depression appeared off the S.E. of Ireland, whence it travelled slowly eastwards and north-eastwards to the Kattegat, which it reached on Friday morning. This system was accompanied by severe thunderstorms in many places. On Wednesday two distinct storms passed over Dublin—the second causing torrents of rain (·550 inch) in an hour (3 15 to 4 15 p.m.). At the Ordnance Survey Office, Phœnix Park, the rainfall on this day was 1·120 inches. Next day also there were heavy thundershowers near this city. Friday proved cloudy and cool, but rainless. On Saturday, however, showers again set in, as a new and large but shallow depression advanced over our northern coasts. In Dublin the mean height of the barometer was 29·768 inches, pressure ranging from 29·532 inches at 9 a.m. of Sunday (wind, W.) to 30·019 inches at 9 p.m. of Friday (wind, N.). The corrected mean temperature was 58·0°, the mean dry bulb readings at 9 a.m. and 9 p.m. being 58·6°. On Wednesday temperature rose to 67·9° in the screen, on Friday it fell to 51·8°. The rainfall measured 1·389 inches, on five days, ·871 inch being registered on Wednesday and ·349 inch on Sunday. The wind was variable—S., N.E., N., and W. being the predominant directions.

Changeable, showery, but withal favourable weather held throughout the week ending Saturday, the 22nd. The general distribution of atmospherical pressure was cyclonic in and near the British Isles—primary systems of some depth passing eastwards across the North of Scotland, while numerous secondary systems brought rain and squalls to the southern half of the United Kingdom also. Owing to the amount of cloud and to the freshness of the S.W. to N.W. winds which prevailed, temperature never became very high and seldom exceeded 70° even in the S.E. and centre of England. On the Continent, when the barometer was higher and conditions were at times anticyclonic, much warmer weather was experienced—at least towards the close of the week. Thus on Thursday the thermometer rose in the shade to 82° in Paris and 88° in Berlin, while the maximum on this day in London was only 68°. At 8 a.m. of Friday temperature was as high as 72° at Stockholm. In Dublin the extremes of temperature for the week occurred on Saturday—the minimum being 50·0° and the maximum 68·9°. The mean height of the barometer in this city was 29·788 inches, pressure ranging from 30·031 inches at 9 p.m. of Monday (wind, N.N.W.) to 29·429 inches at 7.15 p.m. of Wednesday (wind, W.), from which low value it again increased to 30·037 inches at 9 p.m. of Saturday (wind, W.S.W.). The corrected mean temperature was 59·9°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 59·1°. The rainfall amounted to ·350 inch on five days—·161 inch being registered on Tuesday. The prevailing winds were westerly (S.W. and N.W.).

While changeable and far from settled, the weather was chiefly fine and dry in the period ended Saturday, the 29th. The general distribution of pressure was cyclonic in the North, anticyclonic in France and Germany, as well as in the British Islands on Thursday, the 27th, when an area of high pressure passed eastwards across Ireland to England. The fine, quiet weather accompanying this system was of short duration, and on Friday a fresh depression appeared off the N.W. of Scotland, causing clouds to increase and a shift of wind to S.W., from which point it freshened at some stations. Before the anticyclonic period, thunderstorms occurred very generally over the midland, eastern and south-eastern parts of England on Wednesday, but the attendant rainfall was not large. In Manchester, however, ·810 inch fell. Showers fell in many places on the day named, and with the advent of northerly winds and a clearing sky, temperature fell fast in the succeeding night. In Dublin the mean height of the barometer was 30·005 inches—pressure ranging between 29·747 inches at 9 p.m. of Monday (wind, W.) and 30·234 inches at 9 p.m. of Thursday (wind, N.). The corrected mean temperature was 61·9°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 61·3°. On Sunday the thermometer rose to 74·5° in the screen; on Thursday it fell to 50·2°. The rainfall amounted to ·063 inch, of which ·058 inch was measured on Saturday. The prevalent winds were between W. and N.

Sunday, the 30th, was bright and fair in Dublin, but heavy showers fell in Edinburgh and thunderstorms occurred along the east coast of England. Monday, the 31st, was changeable and showery in many places.

The rainfall in Dublin during the seven months ending July 31st amounted to 11·666 inches

on 92 days compared with 13·722 inches on 109 days during the corresponding period in 1892, 10·935 inches on 92 days in 1891, 15·587 inches on 118 days in 1890, 13·146 inches on 112 days in 1889, 15·994 inches on 109 days in 1888, 7·935 inches on 80 days in 1887, and a 25 years' average of 14·733 inches on 112·6 days.

At Knockdolian, Greystones, Co. Wicklow, the rainfall in July was 1·290 inches on 15 days, compared with 2·925 inches on only 10 days in 1892, 1·325 inches on 18 days in 1891, and 1·489 inches, distributed over 18 days in 1890. Of the total rainfall ·360 inch fell on the 9th, and ·330 inch on the 13th. The total fall since January 1 has been 13·066 inches on 90 days, compared with 16·708 inches on 90 days in 1892.

At Cloneevin, Killiney, Co. Dublin, the rainfall in July was 1·36 inches on 17 days, compared with an eight years average of 1·864 inches on 15 days. On the 13th the rainfall was ·26 inch. Since January 1, 1893, 11·05 inches of rain have fallen at this station (Cloneevin).

August.—Although changeable, as in 1892, and forming no exception to the rule that August is characterised by heavy rains, this was a record month as regards high temperature. On no fewer than 14 days did the thermometer exceed 70° in the shade, and the mean temperature was one degree above that of August, 1871, when it reached 62°. The present month also is remarkable for the magnificent display of lightning which occurred on the evening and during the night of the 9th. The cyclonic depressions, which are periodic in the last week of August, arrived about a week earlier than usual, the barometer falling to 28·80 inches off the west coast of Scotland on the 21st.

In Dublin the arithmetical mean temperature (63·0°) was much above the average (59·7°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 61·3°. In the twenty-eight years ending with 1892, August was coldest in 1881 (M. T.=57·0°), and warmest in 1871 (M. T.=62·0°). In 1885, the M. T. was only 57·1°; in 1879 (the "cold year"), it was 57·7°; in 1887, 60·3°; in 1888, 58·2°; in 1889, 58·6°; in 1890, only 57·2°; in 1891, 58·1°; and in 1892, 60·0°.

The mean height of the barometer was 29·965 inches, or 0·068 inch above the corrected average value for August—namely, 29·897 inches. The mercury marked 30·396 inches at 9 a.m. of the 29th, and fell to 29·290 inches at 9 a.m. of the 21st. The observed range of atmospherical pressure was, therefore, 1·106 inches—that is, a little more than an inch and one-tenth.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 61·3°, or 3·7° above the value in August, 1888 and 1889, 5·0° above that in 1890, 4·1° above it in 1891, and 2·3° above it in 1892. It was also 0·8° above the value for July, 1893. Using the formula, *Mean Temp.* = *min.* + (*max.*—*min.* × ·47), the mean temperature was 62·6°, or 3·3° above the average mean temperature for August, calculated in the same way, in the twenty-five years, 1865–89, inclusive (59·3°). The arithmetical mean of the maximal and minimal readings was 63·0°, compared with a twenty-five years' average of 59·7°. On the 15th the thermometer in the screen rose to 79·8°—wind, light and variable; on the 26th the temperature fell to 47·9°—wind, N.W. The minimum on the grass was 41·6° on the 28th.

The rainfall was 2·713 inches, distributed over 16 days. The average rainfall for August in the twenty-five years, 1865–89, inclusive, was 2·825 inches, and the average number of rainy days was 15·5. The rainfall, therefore, was slightly below average, while the rainy days were slightly in excess of the average. In 1874, the rainfall in August was very large—4·946 inches on 18 days; and in 1868 also 4·745 inches fell on, however, only 13 days; but the heaviest downpour in August occurred in 1889, when 5·747 inches were registered on 22 days. On the other hand, in 1884, only ·777 inch was measured on 8 days. In 1887, 1·520 inches of rain fell on 16 days; in 1888, 1·270 inches on 12 days; in 1890, 2·799 inches on 19 days; in 1891, 4·953 inches on 25 days, and in 1892, 3·557 inches on 22 days.

High winds were noted on as many as 10 days, and attained the force of a gale on three occasions—namely, the 4th, 20th and 21st. A thunderstorm of great severity occurred on the 9th. Thunder was also heard on the 18th. Lightning was also seen on the 13nd and 18th. Temperature reached 70° in the screen on as many as 14 days. Hail fell on the 18th. It was foggy on the 12th, 13th, and 14th.

The weather remained changeable and showery, with fresh westerly (S.W. to N.W.) winds, throughout the period ended Saturday, the 5th. A new disturbance reach our northwest coasts on Tuesday, the 1st, leading to rain without much wind. On Wednesday afternoon, however, the barometer fell briskly and the wind backed to S.W. and freshened with a threatening appearance as a much more decided depression approached the N.W. of Ireland from the Atlantic. This system was quickly followed by another on Thursday night, so that by Friday the weather was thoroughly broken, squally and showery, in all parts of the United Kingdom. On the afternoon of this day thunderstorms and heavy rains occurred in London and many other places. A brisk recovery of pressure now took place and the wind drew towards N. and moderated, with fine dry weather on Saturday. In Dublin the mean height of the barometer for the week ended Saturday, the 5th was 29·861 inches, pressure ranging between 29·534 inches at 9 a.m. of Friday (wind, W. by S.) and 30·068 inches at 9 p.m. of Saturday (wind, N.). The corrected mean temperature was 60·4° The mean dry bulb readings at 9 a.m. and 9 p.m. were 58·8°. The screened thermometers rose to 71·3° on Friday and fell to 52·4° on Tuesday. The rainfall was ·813 inch on five days, ·270 inch being measured on Wednesday. The prevailing wind was N.W. Changeable, but very warm and generally summerlike weather characterised the week ended Saturday, the 12th. On Wednesday and Thursday thunderstorms of quite exceptional intensity raged over many parts of England and Ireland, extending subsequently to parts of Scotland also. In Ireland, the distribution of atmospherical pressure was cyclonic, except on Tuesday and Saturday, when a Continental anticyclone spread westwards as far this country. As the general direction of the wind in the British Islands was southerly, temperature ranged very high—the thermometer rising to 85° or 86° at the inland English stations on Tuesday and Wednesday—even at Holyhead a maximum of 83° was reached on Wednesday. The highest in Paris on the same day was 91°. This tropical heat was the more re-

markable, as the week commenced with very low temperatures, indeed, the minima recorded on Sunday morning were 46° in London and at Oxford, 44° at Leith, 43° at York, Loughborough, and Ardrossan; 42° at Sumburgh Head, 41° at Wick and Aberdeen, 40° at Stornoway, and 38° at Nairn! But the most striking phenomenon of the week was the violent thunderstorm of Wednesday night. In Dublin the lightning, which was almost incessant from dusk until after midnight, was extraordinarily vivid. The storm passed from S.S.E. to N.N.W. directly over the city between 10 and 11 p.m., in which time a quarter of an inch of rain fell. The mean height of the barometer was 29·951 inches, pressure ranging between 29·806 inches at 4 p.m. of Thursday (wind, S.E.) and 30·136 inches at 9 p.m. of Saturday (wind, S.). The corrected mean temperature was 65·5°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 63·8°. On Friday the screened thermometers rose to 77·7°, having fallen to 53·0° on Sunday. The rainfall was ·460 inch on four days, ·250 inch being recorded on Wednesday. The prevalent winds were S.W. and S.E.

Many years have passed since such really tropical heat has been experienced in Spain, France, and the British Isles, as that which has made the week ended Saturday, the 19th, memorable in meteorological annals. At Rochefort, on the west coast of France, the daily maxima were 102°, 106°, 91°, 93°, 100°, 90°, and 81°. In London the corresponding values were 81°, 85°, 87°, 90°, 92°, 93°, and 78°. On Thursday night the thermometer did not sink below 72° in London, and by 8 a.m. of Friday it had already risen to 84°. Even in Dublin a maximum of 79·8° was recorded on Tuesday, the 15th—this being the highest shade temperature registered in the Irish capital since July 16, 1876, when the phenomenal reading 87·2 was attained. On Tuesday the maximum at the Ordnance Survey Office, Phœnix Park, was 82·0°; at Glasnevin Botanic Gardens it was 80·6°. Only on the nights of Tuesday and Friday did the minimum fall below 60°. On every day the maximum exceeded 70°. There was an anticyclonic distribution of atmospherical pressure over western Germany, France, England, and Ireland until Thursday, when isobars became cyclonic and decided gradients for southerly winds formed over all parts of the United Kingdom. Thunderstorms of some severity occurred in the North of Ireland and the northern half of Great Britain on Tuesday night, while drenching showers of rain and hail fell in and about Dublin on Friday, accompanied by thunder. It is noteworthy that the weather was quite cool in Scandinavia throughout the week. In Dublin the mean height of the barometer was 29·965 inches, pressure ranging from 30·170 inches at 9 a.m. of Monday (wind, S.S.E.), to a minimum of 29·627 inches at 9 p.m. of Saturday (wind, S.). The corrected mean temperature was 67·9°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 66·6°. On Tuesday, the shade thermometers rose to 79·8°; on Saturday they fell to 58·1°. The rainfall was ·696 inch on two days, ·516 inch falling in heavy showers on Friday, when some hail also fell. The prevailing wind was S.S.W. A good deal of fog hung about the coast on Sunday and Monday. The rainfall at Greystones, County Wicklow, was 1·035 inches on two days. The mean temperature of this week was 73·1° in London, 71·8° at Cambridge, 71·5° at Oxford and Loughborough, 70·5° at Southampton, 70·3° in Manchester, and 70·1° even at Scarborough on the sea.

Opening with typical cyclonic conditions and rough, rainy weather, the week ended Saturday, the 26th, closed with equally well-marked anticyclonic conditions and fine, quiet weather. On Sunday morning a large depression was found off the N.W. of Scotland. This system had caused a heavy rainfall during the previous night in most parts of Ireland and in some parts of Scotland. A few hours later a much more serious disturbance advanced towards the N.W. of Ireland from the S.W., causing a renewed and still heavier rainfall and moderate to fresh gales from S., S.W., and W. at several exposed stations. By 8 a.m. of Monday the barometer was down to 28·90 inches in Donegal, and by 6 p.m. a minimal reading of 28·83 inches was reached at Wick, in Caithnessshire. During the next three days the arrival of several shallow secondary depressions kept the weather in an unsettled, showery state. On Thursday, however, an area of high pressure began to spread over our south-western districts and the N.W. of France, and this brought cool, dry N.W. winds and finer and brighter weather. Towards the close of the period the nights became very sharp, the thermometer in the screen falling on Friday night to 47·9° in Dublin; 46·0 in London, as well as at Wick, Belmullet, and Oxford; and 41·0° at Parsonstown. In Dublin the grass minimum was 41·7°. In Dublin the mean height of the barometer was 29·887 inches, pressure ranging from 29·290 inches at 9 a.m. of Monday (wind, W.S.W.) to 30·343 inches at 9 a.m. of Saturday (wind, N.W.). The corrected mean temperature was 59·6°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 57·9°. On Sunday the thermometer rose to 68·6°; on Saturday it fell to 47·9°. The mean temperature was 8·3° lower than that of the previous week. Rain was measured on four days to the amount of ·718 inch, ·390 inch being entered on Sunday. The prevailing winds were first S.W., then N.W.

The last five days of the month were uneventful but favourable. An anticyclone of considerable intensity for the time of year lay throughout over Ireland and the Atlantic to the westward of this country. The weather was at first bright and cool, with northerly winds; but the sky afterwards became densely clouded, and on Thursday, the 31st, some rain fell with a N.W. wind. Temperature showed some recovery on this the closing day of the month.

The rainfall in Dublin during the eight months ending August 31st amounted to 14·379 inches on 108 days compared with 9·455 inches on 96 days during the same period in 1887, 17·264 inches on 121 days in 1888, 18·893 inches on 134 days in 1889, 18·386 inches on 137 days in 1890, 15·888 inches on 117 days in 1891, 17·279 inches on 131 days in 1892, and a 25 years' average of 17·558 inches on 128·1 days.

At Knockdolian, Greystones, Co. Wicklow, the rainfall in August, 1893, was 3·275 inches, distributed over 16 days. Of this quantity ·690 inch fell on the 19th. The total fall since January 1 amounts to 16·341 inches on 106 days, compared with 21·296 inches on 108 days in 1892.

SEPTEMBER.—September, 1893, was favourable throughout. It was a month of average temperature, with fresh westerly and north-westerly winds, and frequent showers, but no heavy rains near

Dublin. At times the nights were very sharp, and even frosty, but, on the other hand, much bright sunshine was enjoyed by day. Towards the close the autumnal tints in the foliage were lovely beyond compare.

In Dublin the arithmetical mean temperature (55·9°) was as nearly as possible equal to the average (55·8°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 54·8°. In the twenty-eight years ending with 1892, September was coldest in 1886 and in 1882 (M. T.=53·0°), and warmest in 1865 (M. T.=61·4°). In 1880, the M. T. was as high as 58·6°; in 1879 (the "cold year"), it was 54·3°; in 1887, 54·0° ; in 1888, 54·4°; in 1889, 55·8°, or exactly the average; in 1890, it was as high as 59·6°; in 1891, it was 57·6°, and in 1892, 54·5°. So warm a September as that of 1890 had not occurred for a quarter of a century.

The mean height of the barometer was 29·848 inches, or 0·062 inch below the corrected average value for September—namely, 29·910 inches. The mercury rose to 30·345 inches at 9 a.m. of the 12th, and fell to 29·052 inches at 9 a.m. of the 29th. The observed range of atmospherical pressure was, therefore, 1·293 inches—that is, a little more than one inch and a quarter.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 54·8°, or as much as 6·5° below the value for August, 1893. Using the formula, *Mean Temp.* =*min.* + (*max.* − *min.* × ·476), the mean temperature was 55·5°, or exactly equal to the average mean temperature for September, calculated in the same way, in the twenty-five years, 1865–89, inclusive (55·5°). The arithmetical mean of the maximal and minimal readings was 55·9°, compared with a twenty-five years' average of 55·8°. On the 5th, the thermometer in the screen rose to 72·0°—wind, S.S.W. ; on the 21st the temperature fell to 38·2°—wind, N.W. The minimum on the grass was 31·7° on the 24th. On the 21st the grass minimum was 31·9°.

The rainfall was only ·729 inch, distributed over as many as 14 days—the rainfall was thus considerably below the average. The average rainfall for September in the twenty-five years, 1865–89, inclusive, was 2·176 inches, and the average number of rainy days was 14·7. In 1871, the rainfall in this month was very large—4·048 inches on, however, only 13 days. On the other hand, in 1865, only ·056 inch was measured on but 3 days. In 1888, the rainfall was only ·728 inch on 10 days; in 1889, 1·043 inches fell on 13 days; in 1890, 2·469 inches on 14 days; in 1891, 2·132 inches on 18 days; and in 1892, 2·631 inches on 19 days.

High winds were noted on as many as 14 days, but attained the force of a gale on no occasion in Dublin. An aurora appeared on the 1st. Lightning was seen on the 8th and 21st. Thunder was heard on the 21st. The atmosphere was foggy on the 3rd, 4th, and 12th.

The month opened with an anticyclone forming over Ireland, where the weather during the first two days was mild and fine, although rather cloudy. In England rain had fallen, and the weather was taking up. In Scotland conditions were still unsettled and rainy. North-westerly winds were prevalent in nearly all parts of the United Kingdom.

During the week ended Saturday, the 9th, the weather, which was at first fair and warm, afterwards became cloudy, showery, squally, and finally cold for the time of year. On Sunday morning an anticyclone lay right over the British Islands, in all parts of which the barometer was high and remarkably uniform, the morning readings varying not one-tenth of an inch, from 30·30 inches at Loughborough, in Leicestershire, to 30·22 inches at Belmullet, in Mayo, and 30·21 inches at Valentia Island in Kerry. The weather was fair and bright after a calm, dewy and (in places) foggy morning. During the following two days the anticyclone retreated in a south-easterly direction to the Continent. and the barometer fell steadily. The wind meanwhile became S.W. in the North, and E. or S.E. in the South, temperature rising considerably on Tuesday—to 72° in Dublin and at Leith, 74° at York and Hurst Castle, 75° at Oxford, and 77° in London, at Loughborough and Cambridge. Wednesday was still hotter in the midlands and south of England, the thermometer reaching 80° at Cambridge and 81° in London ; but already a decided fall of temperature had begun in Scotland and Ireland, and was spreading south-eastwards with clouds, rain, and high westerly winds. On Friday a V.-shaped thunderstorm depression travelled south-eastwards across Great Britain, and in its rear temperature gave way still more rapidly, so that Saturday was quite a cool day. In Dublin the mean atmospheric pressure was 29·914 inches, pressure ranging between 30·275 inches at 9 a.m. of Sunday (wind, E.N.E.), and 29·570 inches at 9 p.m. of Wednesday (wind, W.S.W.). The corrected mean temperature was 58·7°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 57·3°. On Tuesday the screened thermometers rose to 72·0°, on Saturday they fell to 44·0°. Rain was registered on three days, the total measurement being ·252 inch, of which ·174 inch was recorded on Wednesday. Sheet lightning was seen on the eastern horizon on Friday evening. The prevalent winds were S.W. and N.N.W.

The two most striking features in the weather of the week ended Saturday, 16th, are the low night temperatures at the beginning and the continuous drought, except in the north and the extreme south of the British Islands. During Sunday and Monday a depression was passing south-eastwards from the mouth of St. George's Channel across the Bay of Biscay to the Peninsula. This disturbance caused heavy rains in the extreme S.W. of England, along the west coast of France, and finally in central Spain. Its presence was made evident from Dublin on Saturday, the 9th, as well as throughout Sunday, by a sheet of cirriform cloud which kept travelling in an upper current from W. to E. over the southern half of the sky. A strong easterly wind at the same time showed that an area of low barometer lay to the southward. As this breeze died down, the nights became very sharp in England and Ireland. At Parsonstown the screened thermometer fell to 36° on Monday night and to 31° on Tuesday night. At Loughborough also the minimum on Monday night was 31°, or one degree below freezing-point. Large depressions now began to pass eastward across Northern Europe, so that for the rest of the week squally westerly (S.W. to N.W.) winds, high but variable temperatures, and cloudy skies—with heavy rain in the extreme north—were experienced. At Glencarron, in Ross-shire, the rainfall of this week was as much as 6 inches. In Dublin the mean height of the barometer was 30·146 inches, readings varying from 30·345 inches at 9 a.m. of Tuesday (wind calm), to 29·923 inches at 9 p.m. of Saturday (wind, N.W.). At 4 p.m. of this day a reading

of 29·892 inches was recorded. The corrected mean temperature was 56·9°. The mean dry bulb readings in the screen at 9 a.m. and 9 p.m. were 57·1°. On Tuesday the minimum was 40·5°, on Friday the maximum was 70·0°. Light showers fell on Friday evening, yielding only ·008 inch of rain. The prevalent winds were E., W.S.W., and N.W.

All through the week ended Saturday, the 23rd, the atmosphere was in a disturbed state over north-western Europe, and cyclonic conditions prevailed generally. On Tuesday and the two following days a depression of the first magnitude lay between Scotland and Norway, while a series of secondary depressions travelled south-eastwards across the British Islands, keeping the weather in a changeable, squally, showery condition, especially on our northern and north-western coasts. The amount of atmospherical depression may be gauged by the fact that on Tuesday the barometer fell to 28·76 inches at Sumburgh Head, in the Shetlands. On Wednesday evening sheet lightning was seen from the shores of the Irish Sea, St. George's Channel, and the English Channel. At night sharp frost occurred over central Ireland and in some inland parts of England also. At 8 a.m. of Thursday a thunderstorm prevailed in the Scilly Isles, connected with a large secondary depression which at that time lay over Brittany. On the evening of this day massive cumuli and nimbi were seen from the east coast of Ireland passing southwards down the Irish Sea—vivid flashes of lightning shot from these clouds from time to time, and distant thunder was heard at intervals. On Friday night another secondary depression brought a considerable rainfall, followed by a renewed fall of temperature and fresh northerly winds on Saturday. On Friday and Saturday showers of snow and sleet fell in Scotland and over the north of England. In Dublin the mean height of the barometer was 29·612 inches, readings decreasing from 29·832 inches at 9 a.m. of Sunday (wind, W.N.W.) to 29·330 inches at 3 p.m. of Tuesday (wind also W.N.W.), but rising again intermittently to 29·877 inches at 9 p.m. of Saturday (wind, N.W.). The corrected mean temperature was 50·9°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 50·2°. On Monday the thermometer rose to 63·8° in the shade; on Thursday it fell to 38·2° in the shade and to 31·9° on the grass. The rainfall was ·191 inch on four days—·112 inch being measured on Friday. The wind was generally N.W., varying only between W. and N.

A cyclonic distribution of atmospherical pressure over western and northern Europe caused the weather to be of a changeable, showery, and squally character throughout the week ended Saturday, the 30th. At the beginning, no doubt, an anticyclone was found over Ireland in the rear of a depression overlying the Skager Rack, but this high pressure area soon gave place to a new disturbance, which at 8 a.m. of Tuesday had its centre over Donegal, Derry, and Antrim. This system travelled eastwards, causing heavy rain, first in the north of Ireland, afterwards in the north of England. Indeed, on Wednesday thunderstorms occurred generally along the east coast of England and at the Helder, in connection with this depression. By 8 a.m. of Thursday a very decided reduction of pressure was in progress all over the British Islands and Scandinavia, and a large and deep depression was approaching the N.W. of Scotland. The showers now became heavier and more frequent in nearly all places, while the wind blew more and more gustily and strongly from S.W. or W. At 8 a.m. of Friday the barometer was down to 28·65 inches at Stornoway in the Hebrides, where a fresh southerly breeze was blowing. The reading was 30·00 inches at Nice and 30·06 inches at Lisbon at the same hour. Gales prevailed at many exposed stations—from S.E. in Norway, but from S.W. or W. in the English Channel, and at Pembroke. The showery weather continued to the close of the week; but fine, bright intervals were enjoyed. In Dublin the mean height of the barometer was 29·619 inches, the range of pressure being from 30·079 inches at 9 a.m. of Sunday (wind, W.N.W.) to 29·052 inches at 9 a.m. of Friday (wind, W.S.W.). The corrected mean temperature was 54·2°. The mean daily dry bulb reading at 9 a.m. and 9 p.m. was 53·1°. On Sunday the thermometer fell to 38·9° in the shade; on Thursday it rose to 63·5°. Rain fell in measurable quantity on six days, the total precipitation being ·278 inch, of which ·060 inch was referred to Thursday. The prevailing winds were westerly (W.N.W to S.W.). Lunar rainbows were seen at Greystones, Co. Wicklow, on Thursday evening. Thunder and lightning occurred in many parts of Ireland in the course of the same night.

The rainfall in Dublin during the nine months ending September 30th amounted to 15·108 inches on 122 days, compared with 10·968 inches on 112 days during the same period in 1887, 17·992 inches on 131 days in 1888, 19·936 inches on 147 days in 1889, 20·855 inches on 151 days in 1890, 18·020 inches on 135 in 1891, 19·910 inches on 150 days in 1892, and a twenty-five years' average of 19·734 inches on 142·8 days.

At Knockdolian, Greystones, County Wicklow, the rainfall in September, 1893, was ·750 inch distributed over 12 days. Of this quantity ·150 inch fell on the 25th, and ·140 inch on the 6th. At that station the rainfall since January 1, 1893, has been 17·091 inches on 118 days, compared with 23·883 inches on 125 days in the same nine months of 1892.

At Cloneevin, Killiney, Co. Dublin, the rainfall in August, 1893, was 2·39 inches on 20 days (the maximal fall in 24 hours being ·37 inch on the 20th), compared with an eight years' average of 2·845 inches on 15·25 days. In September, 1893, only ·46 inch fell at Cloneevin on 11 days. The maximal fall in 24 hours was ·14 inch on the 6th. On an average of eight years the September rainfall at this station has been 1·767 inches on 12·5 days. Since January 1, 1893, 13·90 inches of rain have fallen at Cloneevin.

OCTOBER.—A favourable month, of average mean temperature and atmospheric pressure. There was an overwhelming prevalence of westerly and south-westerly winds, which kept the rainfall far below the average on the leeward side of the Dublin and Wicklow mountains—thus, it was only 7·10 inch at both Greystones and Killiney; 1·033 inches in Dublin city; 1·140 inches at the Royal Botanic Gardens, Glasnevin; and 1·190 inches at the Ordnance Survey Office, Phœnix Park. Free of the mountains inland, the rainfall was much heavier. Even in London, not less than 3·900 inches of rain fell during the month. On the . h and 21st there was a remarkable wave of heat. On the 30th and 31st the cold was equally deci. ed.

In Dublin the arithmetical mean temperature (50·0°) was slightly above the average (49·7°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 48·8°. In the twenty-eight years ending with 1892, October was coldest in 1892 (M. T. = 44·8°), in 1880 (M. T. = 45·4°), and in 1885 (M. T. = 45·5°), and warmest in 1876 (M. T. = 53·1°). In 1886, the M. T. was as high as 52·0°; in 1879 (the "cold year"), it was 49·7°; in 1887, as low as 47·3°; in 1888, it was 49·1°; in 1889, it was only 48·1°; in 1890, it was 51·7°, and in 1891, it was 49·5°. October, 1892, beat the record for coldness, but October, 1893, has proved of normal warmth.

The mean height of the barometer was 29·855 inches, or 0·015 inch above the corrected average value for October—namely, 29·840 inches. The mercury rose to 30·507 inches at 9 a.m. of the 23rd, and fell to 29·061 inches at 9 a.m. of the 4th. The observed range of atmospherical pressure was, therefore, as much as 1·446 inches—that is, a little less than an inch and a half.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 48·8°, or 6·0° below the value for September. The arithmetical mean of the maximal and minimal readings was 50·0°, compared with a twenty-five years' average of 49·7°. Using the formula, *Mean Temp.* = *Min.* + (*max.*—*min.* × ·485), the value was 49·8°, or 0·3° above the average mean temperature for October, calculated in the same way, in the twenty-five years, 1865-89, inclusive, (49·5°). On the 21st, the thermometer in the screen rose to 67·7°—wind, S.W.; on the 31st the temperature fell to 31·7°—wind, N.W. The minimum on the grass was 24·9°, also on the 31st. On one night the thermometer sank below 32° in the screen, and on eight nights frost occurred on the grass. The corresponding figures in 1892 were 4 and 13 nights respectively.

The rainfall was only 1·033 inch, distributed over 16 days—the rainfall was considerably, while the rainy days were slightly, below the average. The average rainfall for October in the twenty-five years, 1865–89, inclusive, was 3·106 inches, and the average number of rainy days was 17·6. In 1880 the rainfall in October was very large—7·358 inches on 15 days. In 1875, also, 7·049 inches fell on 26 days. On the other hand, in 1890 only ·639 inch fell on but 11 days, in 1884 only ·834 inch on but 14 days, and in 1868 only ·856 inch on 15 days. In 1888, the rainfall was 1·227 inches on 16 days, and in 1889 no less than 4·853 inches fell on 22 days. In 1891, 3·590 inches fell on 13 days; and in 1892, 2·535 inches on 17 days. From these figures it will be seen that October, 1890, proved the driest on record for more than a quarter of a century at least, while the rainfall in October, 1893, was only *one-third* of the average.

A lunar corona was seen on the 24th. There was an aurora borealis on the evening of the 29th. High winds were noted on 10 days, and attained the force of a gale on two occasions—the 25th and 28th. The atmosphere was more or less foggy in Dublin on the 7th, 18th, and 20th. Lightning was seen on the evenings of the 3rd, 4th, 5th, and 30th. Hail fell on the 26th.

The week ended Saturday, the 7th, proved to be one of low atmospherical pressure, low temperature, and changeable showery weather, the showers being from time to time accompanied by thunder and lightning in many places. The most important reduction of pressure occurred on Tuesday and Wednesday—at 8 a.m. of the latter day the barometer was below 29 inches throughout a large triangular area covering two-thirds of Scotland, the north of England, and the north-eastern third of Ireland. Gradients were nowhere steep, and so the winds—although varying much in direction—were not strong except off the south of Ireland and in the English Channel. Connected with this large primary cyclonic system, were a number of shallow secondary depressions, which caused thunder and hail—as well as rain—showers as they passed across the country. Temperature was not so low in the S. and S.E. of England as in other parts of the kingdom, and on Sunday the thermometer rose to 67° at Loughborough and Cambridge, 66° in London and at Dungeness, and 65° at Hurst Castle. On the other hand, a minimum of 28° was registered at Nairn, in Scotland, on Wednesday morning. In Dublin the mean height of the barometer was 29·362 inches, pressure being observed to vary between 29·624 inches, at 9 p.m. of Sunday (wind, W.), and 29·061 inches, at 9 a.m. of Wednesday (wind also W.). The corrected mean temperature was 49·3°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 47·2°. On Sunday the thermometer rose to 59·2°, on Saturday it fell to 37·9° in the screen. The rainfall was ·168 inch on five days, ·051 inch being measured on Wednesday. Lightning was seen on the evenings of Tuesday, Wednesday, and Thursday. The prevailing wind was westerly. The weather was much more broken in England than in Ireland during the week.

Atmospherical pressure was unsteady during the week ended Saturday, the 14th, and therefore the weather was unsettled and changeable. Until Friday, when a very warm, moist south-westerly, or equatorial current began to pass over Ireland, the air was cold and rather dry in this country. In England, on the contrary, heavy falls of rain took place, accompanied by thunder and lightning and at times by strong and squally S.W. winds. In London, from one inch to an inch and a quarter of rain fell on Monday night, and the total fall for the three days ending 8 a.m. of Thursday was no less than 1·84 inches. These heavy rains were due to the passage up the English Channel of two depressions in quick succession—one on Monday, the other on Wednesday. At this time, although the barometer was rather low, bright, sharp weather prevailed in Ireland, showers occurring at intervals. On Thursday an area of high pressure passed over this country. The weather turned colder and became fine and dry in England, while in Ireland a warm S.W. wind arrived on Friday, causing dull, rainy weather, and an increase of temperature amounting to from 20° to 25° Fahr. The result in Dublin was that on Saturday the interior of most houses became dripping wet, from the condensation as dew of the vapour of the warm air current upon the walls, ceilings, and floors, chilled by the previous cold weather and remaining below the point of saturation or the dew point. Rain fell heavily on Saturday afternoon. In Dublin the mean height of the barometer was 29·846 inches, pressure ranging between 29·683 inches at 9 a.m. of Sunday (wind, W.), and 30·160 inches at 9 p.m. of Thursday (wind, W.N.W.). The corrected mean temperature was 48·8°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was also 48·8°. On Tuesday the thermometers in the screen fell to 37·1°, on Saturday they rose to 65·0°. The rainfall was ·431 inch on three days, ·322 inch being measured on Saturday. The prevalent winds were W. and S.W.

Taken as a whole, the weather of the week ended Saturday, the 21st, was distinctly favourable and of a mild type—indeed, both of the beginning and at the end temperature was much above normal, although the minima were low on Tuesday night in Scotland and parts of both England and Ireland, and on Wednesday and Thursday nights in central England. On the other hand, Friday night proved abnormally warm in many places, and in Dublin the thermometer actually rose to 67·7° (nearly 68°) in the screen. Comparatively little rain fell, except in the south of Ireland and over the south and east of England as well as in parts of the English Midlands on Tuesday, when a shallow depression travelled in a direction from W.N.W. to E.S.E. from the mouth of St. George's Channel across the S.W. of England to the N.E. of France. This rain-system caused falls of 1·25 inches at Roche's Point, 1·57 inches at Hurst Castle, where a storm of thunder and lightning occurred at 1.30 a.m. of Wednesday, and ·75 inch in London. The rainfall was ·67 inch at Parsonstown, but only ·07 inch in Dublin. As this disturbance passed off, an anticyclone formed in the S., and the barometer rose to 30·40 inches or slightly more on Friday morning over the S. of England, N. of France, and centre of Germany. Along the north-western face of this anticyclone a very warm south-westerly current spread over Ireland on Friday, the temperature becoming singularly high at night. Saturday was first fine and warm, afterwards rainy and much cooler. In Dublin the mean height of the barometer was 30·099 inches, pressure ranging between a minimum of 29·762 inches at 9 p.m. of Sunday (wind, W.S.W.) and 30·370 inches at 9 a.m. of Thursday (wind, S.W.). The corrected mean temperature was 55·4°. The mean dry bulb reading at 9 a.m. and 9 p.m. was 54·5°. On Saturday the thermometers in the screen rose to 67·7°; on Wednesday they fell to 41·0°. The rainfall was ·238 inch on four days, ·098 inch being measured on Saturday. The prevailing winds were W. and S.W. A wet fog prevailed on Wednesday morning, and there was a smoke fog on Friday.

At first fine and dry, except in the S. and S.E. of England, where Sunday was dull and rainy, the weather afterwards became squally, showery, and generally changeable during the week ended Saturday the 28th. In the earlier period, an anticyclone lay over the S. of Ireland, the barometer rising on Monday morning to 30·55 inches at Valentia Island and Roche's Point, 30·52 inches at Parsonstown, and 30·51 inches in Dublin. This high pressure system soon moved away south-eastwards, and at the same time decreased in size. Simultaneously, a general reduction of atmospheric pressure took place in the N. and N.W., causing steeper gradients for westerly winds—that is, winds between S.W. and N.W., and showery, unsettled weather. On Tuesday and Wednesday rain fell heavily over the N. of Ireland and S. of Scotland, and in smaller quantities over the greater part of the kingdom. Hail fell in many places and lightning was seen at Belmullet on Wednesday night. On Thursday evening the moon shone with unusual lustre. A decided rise of temperature occurred on Friday, while Saturday was stormy with frequent showers, and, at times, rainbows. In Dublin the mean height of the barometer was 30·038 inches, pressure rising to 30·507 inches at 9 a.m. of Monday (wind, W.) and falling to 29·638 inches at 4 p.m. of Saturday (wind, W.). The corrected mean temperature was 49·6°. The mean of the dry bulb readings at 9 a.m. and 9 p.m. was 49·2°. On Wednesday the thermometer rose to 59·8° in the screen; on Friday, it fell to 38·2°. The rainfall was ·184 inch on three days—·109 inch being registered on Wednesday and ·041 inch on Saturday. The prevailing wind was westerly.

The last three days were cool and fair in Ireland—an aurora borealis with carmine streamers was seen about 6 p.m. of Sunday, the 29th, and there was sheet lightning on the evening of the 30th. Sharp frost occurred on the 31st.

The rainfall in Dublin during the ten months ending October 31st amounted to 16·141 inches on 138 days, compared with 12·366 inches on 123 days during the same period in 1887, 19·219 inches on 147 days in 1888, 24·789 inches on 169 days in 1889, 21·494 inches on 162 days in 1890, 21·610 inches on 148 days in 1891, 22·445 inches on 167 days in 1892, and a twenty-five years' average of 22·840 inches on 160·4 days.

At Knockdolian, Greystones, Co. Wicklow, the rainfall in October amounted to only ·710 inch on 15 days. Of this quantity ·225 inch fell on the 17th. The rainfall at Greystones in October, 1889 was no less than 6·935 inches on 22 days, or more than 11 times as great as the fall in October, 1890, when only ·600 inch fell on 13 days. In 1891, 5·122 inches fell on 14 days, and in 1892, 3·340 inches on 15 days. From January 1st, 1893, up to October 31st, rain fell at Knockdolian on 133 days to the total amount of 17·801 inches. In 1892, the rainfall of the corresponding ten months was 27·223 inches on 140 days.

At Cloneevin, Killiney, Co. Dublin, the rainfall in October, was ·710 inch on 14 days, compared with 3·040 inches on 17 days in 1892, and an eight years' average of 3·201 inches on 16 days. Since January 1, 1893, 14·61 inches of rain have fallen at this station, compared with an average of 20·353 inches in the previous eight years.

November.—This was a generally favourable month. Its leading characteristics were—a prevalence of northerly winds, a tolerably low mean temperature, an absence of calm and fog, a moderate rainfall, but a high percentage of cloud.

The memorable storm of the period from the 16th to the 19th inclusive deserves special mention. The cyclonic depression which caused it was of great intensity, the barometer falling in its centre to about 28·5 inches on the morning of the 17th, and the system pursued a very erratic course, travelling in the first instance from S.S.W. to N.N.E., acrcss Ireland and Scotland to the Moray Firth, and then "turning tail" and passing in a south-easterly direction down the east coast of Great Britain to the continent, over which it finally dispersed. The wind-velocity during the northerly gales of this depression was great everywhere, but it was altogether exceptional at Holyhead, where the anemometer registered 1,824 miles of wind in 24 hours, and in the hour 10.30 a.m. to 11.30 a.m. 89 miles were recorded.

A slight shock of earthquake was felt at Greystones, Co. Wicklow, at 5.35 p.m. of the 2nd.

In Dublin the arithmetical mean temperature (43·8°) was decidedly below the average (44·7°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 43·3°. In the twenty-eight years ending with 1892, November was coldest in 1878 (M. T. = 38·2°), and in 1870 (M. T. = 42·2°), and warmest in 1881 (M. T. = 50·3°). In 1886, the M. T. was as high as 46·4°; in the year 1879 (the "cold year") it was 43·9°; in 1887, it was as low as 42·6°; in 1888, it was as high as 47·5°; in 1889, it was 46·4°; in 1890, 45·3°; in 1891, 43·4°; and in 1892, as high as 46·9°.

The mean height of the barometer was 30·058 inches, or 0·198 inch above the corrected average value for November—namely, 29·860 inches. The mercury rose to 30·594 inches at noon of the 21st, having fallen to 28·719 inches at midnight of the 16th. The observed range of atmospherical pressure was, therefore, 1·875 inches—that is, slightly less than one inch and nine-tenths.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 43·3°, or 5·5° below the value for October, and 11·5° below that for September, 1893. The arithmetical mean of the maximal and minimal readings was 43·8°, compared with a twenty-five years' average of 44·7°. On the 3rd the thermometer in the screen rose to 57·6°—wind, W.S.W.; on the 7th the temperature fell to 30·8°—wind, calm. The minimum on the grass was 23·9°, also on the 7th.

The rainfall was 1·870 inches, distributed over 17 days—the rainfall was considerably below, while the rainy days were exactly equal to the average. The average rainfall for November in the twenty-five years, 1865-89, inclusive, was 2·452 inches, and the average number of rainy days was 17·0. In 1876 the rainfall in November was large—3·614 inches on 20 days; in 1872, also, 3·414 inches fell on 24 days; in 1887, 3·012 inches fell on 18 days; in 1888, 6·549 inches fell on 26 days; in 1890, 4·212 inches fell on no less than 27 days; in 1891, 2·911 inches fell on 15 days, and in 1892, 2·404 inches on 19 days. On the other hand, the rainfall in 1889 was only ·929 inch on 9 days; in 1870, only 1·218 inches were measured on but 11 days, and in 1879, only 1·251 inches on but 10 days.

High winds were noted on 15 days, but attained the force of a gale on only four occasions—the 16th, 17th, 18th, and 29th. The atmosphere was more or less foggy in Dublin on the 4th, 7th, 13th, 14th, and 30th.

A lunar halo was seen on the 21st. Snow or sleet fell on the 6th, 18th, 19th, and 23rd; hail on the 6th, 7th, 19th, 22nd, and 23rd.

With the coming of November, as in 1892, so in 1893, cold frosty weather gave place to comparative warmth and south-westerly winds. A severe frost had visited central England early on Tuesday evening, October 31, but in the course of the following night temperature rose with extreme rapidity, so that Parsonstown was 21° warmer at 8 a.m. on Wednesday, the 1st, than it had been 24 hours previously. On Thursday a secondary V-shaped depression crossed England from W. to E., causing a copious rainfall. Friday was a cloudy, mild, breezy day, but on Saturday a shift of wind to N.E. took place, and the air became drier and colder.

During the week ended Saturday, the 11th, showery, cloudy, and generally changeable weather, with north-easterly winds, prevailed. After Sunday an anticyclone was constantly found to the northwestward of the British Islands, while atmospherical pressure was relatively low both over the Baltic and over the Mediterranean Basin. At first areas of particularly sharp cold were found over the central districts of both England and Ireland—at 8 a.m. of Sunday the thermometer was as low as 22° at Loughborough and 25° at Cambridge and Parsonstown. At the first-named station it had been down to 19° during the previous night. In Dublin this day was fine, dry, and cold, but on Monday morning heavy showers of hail, sleet, and snow came up on a N.E. wind. In the neighbourhood of Stillorgan, Co. Dublin, some three inches of snow lay on the ground to an advanced hour in the forenoon. The frost continued inland, where also the weather remained dry. As usual in N.E. winds, the weather was most severe and broken in the extreme S.E. of England, where thunder and lightning accompanied sharp showers of cold rain and hail on Monday and Tuesday. After Wednesday temperature recovered, although the N.E. wind even freshened, and Saturday proved the mildest day of the whole week. In Dublin the mean height of the barometer was 30·344 inches, pressure ranging from 29·961 inches at 9 a.m. of Sunday (wind, W.N.W.) to 30·465 inches at 9 a.m. of Wednesday (wind, N.N.E.). The corrected mean temperature was 42·8°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 42·3°. On Tuesday the minimum was 30·8°, on Saturday the maximum was 50·7°. Rain fell on five days in frequent but not heavy showers, the maximal fall in 24 hours being ·049 inch on Wednesday, and the total fall amounting to ·162 inch. Hail, sleet, and snow fell on Monday morning.

The weather during the week ended Saturday, the 18th, was at first anticyclonic, quiet, and fair, but it afterwards fell into a most unsettled stormy condition, severe gales from opposite quarters blowing on the last three days of the week. At the beginning an anticyclone lay over the British Islands, the North Sea, Holland, and North Germany—the barometer slightly exceeded 30·50 inches in the N.E. of Scotland. On Monday beautiful weather prevailed, but already a depression was advancing northwards across Spain and the Bay of Biscay. This system finally passed up the English Channel on Tuesday, and caused heavy rain both in France and in the S. and S.E. of England —·720 inch of rain fell in London, while Dublin got only ·009 inch in the form of a drizzle on Tuesday evening. Wednesday proved fine and dry, but at night the wind veered from E. to S.E., and freshened in front of a very deep depression, which on Thursday night passed directly over Ireland, travelling in a north-north-easterly direction. This disturbance brought a heavy rainfall to the Irish and Scotch stations—·821 inch fell in Dublin up to 9 a.m. of Friday, the heaviest fall in this city since July 12, when ·871 inch fell in two thunderstorms. About midnight on Thursday the barometer read 28·719 inches, the lowest reading recorded in Dublin since October 13, 1891, when the mercury fell to 28·251 inches. In front of the cyclonic centre a fresh S.E. gale and high temperature prevailed; in its rear came a violent N. storm and bitter cold on Saturday, when also

the depression changed its course and travelled southwards down the North Sea. In Dublin the mean height of the barometer was 29·740 inches, pressure ranging between 30·382 inches at 9 a.m. of Sunday (wind, E.), and 28·719 inches at midnight of Thursday (wind, S.). The corrected mean temperature was 43·0°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 42·2°. On Friday the thermometers in the screen rose to 55·1°, having fallen to 34·4° on Tuesday. The rainfall amounted to ·954 inch on three days—·821 inch being registered on Thursday. Snow showers fell on Saturday afternoon. The prevailing winds were E.S.E. and N.W. At Holyhead a gale from N. of hurricane force was reported on Saturday morning.

Changeable and unsettled weather held during the week ended Saturday, the 25th. At first, bitter northerly gales and showers of snow and hail prevailed in connection with the deep depression which had travelled northwards and then southwards across the British Islands in the closing days of the previous week. As the centre of this disturbance reached the Continent on Sunday morning, the barometer rose with great rapidity over the United Kingdom, so that gradients for northerly winds became excessively steep. The result was a disastrous northerly gale, which strewed the coasts of North-western Europe with wrecks and wreckage. The rise of the barometer continued until Tuesday morning, when the reading was 30·63 inches at Belmullet. Depressions then began to pass eastwards over Northern Europe, with their secondaries spreading south-eastwards over the British Islands, where showers of hail, sleet, or snow again fell plentifully at exposed stations. During Friday and Saturday a deep depression passed directly over our area, causing mild, damp. squally weather and a general fall of rain. The week closed with a finer and clearer state of the atmosphere. In Dublin the mean height of the barometer was 30·212 inches, pressure ranging from 30·594 inches at noon on Tuesday (wind, N.) to 29·457 inches at 9 p.m. of Saturday (wind, W.N.W.), The corrected mean temperature was 41·1°, which was also the value of the mean dry bulb readings at 9 a.m. and 9 p.m. On Thursday the screened thermometers fell to 31·7°, on Saturday they rose to 52·9°. Rain fell in registrable quantity on four days to the total amount of ·214 inch, ·162 inch being measured on Saturday. Snow and hail fell on Sunday and Thursday, hail on Wednesday also. The prevailing winds were N.E. and N.W.

The period from Sunday, the 26th, to Thursday, the 30th, inclusive, was chiefly remarkable for the sudden and extreme changes of temperature which occurred at its beginning and close. On the 26th, the thermometer stood low under the influence of a fresh northerly wind, forming part of the circulation round a depression whose centre had advanced from the N. of Scotland to Denmark by 8 a.m. Monday, the 27th, brought milder, damper weather and freshening westerly winds. The next two days were warm, but blustering, with a good deal of cloud, and squally W.S.W. winds. Rain fell at exposed stations, most heavily in Scotland. In the course of the night of the 29th–30th rain set in afresh, and the wind shifted to the northward, in the rere of a series of V-shaped depressions, which subsequently travelled towards S.E. across North-western Europe. A rapid fall of temperature followed beginning in the far N., and quickly extending southwards. In Dublin the mean height of the barometer during this closing period of the month was 30·054 inches, pressure varying from 30·289 inches at 9 a.m. of Monday (wind, W.) to 29·829 inches at 9 p.m. of Thursday (wind N.N.W.). The corrected mean temperature of the 5 days was 47·6°, the mean dry bulb temperature at 9 a.m. and 9 p.m. being 46·2°. On Sunday, the screened thermometer fell to 36·9°; on Tuesday it rose to 56·5°. Rain fell on the 29th to the amount of ·144 inch; on the 30th to the amount of ·143 inch; total precipitation, ·287 inch. The prevalent winds were N.N.W. and W.S.W.

The rainfall in Dublin during the eleven months ending November 30th amounted to 18·011 inches on 155 days, compared with 15·378 inches on 141 days during the same period in 1887, 25·768 inches on 173 days in 1888, 25·718 inches on 178 days in 1889, 25·706 inches on 189 days in 1890, 24·521 inches on 163 days in 1891, 24·849 inches on 186 days in 1892, and a twenty-five years' average of 25·292 inches on 177·4 days.

At Knockdolian, Greystones, Co. Wicklow, the rainfall in November, 1893, was 1·785 inches, distributed over 17 days. Of this quantity ·320 of an inch fell on the 17th, and ·310 of an inch on the 30th.

From January 1st, 1893, up to November 30th, rain fell at Knockdolian, Greystones, on 150 days, and to the total amount of 19·586 inches.

At Cloneevin, Killiney, Co. Dublin, 1·40 inches of rain fell on 17 days, compared with an eight years' average of 3·048 inches on 18·25 days. The maximal fall in 24 hours was ·31 inch on the 16th. Since January 1st, 1893, 16·01 inches of rain have fallen at this station, compared with an eight years' average of 23·401 inches.

December.—A generally open, rainy, squally month. The prevailing trend of the atmospheric depressions was from S.W. to N.E. along the western shores of the British Isles and of Scandinavia. At the close of the month an anticyclone spread westwards from the Continent to the British Isles, and was accompanied by an abrupt fall of temperature, much cloud and fog. The rainfall of the whole month (2·482 inches) was above the average. Several serious gales were felt, but calms with fog prevailed during the closing days of the month.

In Dublin the arithmetical mean temperature (43·5°) was decidedly above the average (41·3°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 42·8°. In the twenty-eight years ending with 1892, December was coldest in 1878 (M. T. = 32·8°), and in 1874 (M. T. = 36·8°), and warmest in 1865 (M. T. = 46·2°). In 1886 the M. T. was as low as 37·9°; in the year 1879 (the "cold year") it was also 37·9°. In 1887 the M. T. was 39·9°; in 1888 43·6°; in 1889 43·8°; in 1890 39·2°; in 1891, 43·0°; and in 1892 39·6°.

The mean height of the barometer was 29·868 inches, or 0·013 inch below the corrected average value for December—namely, 29·875 inches. The mercury rose to 30·706 inches at 9 a.m. of the 30th, and fell to 28·530 inches at noon of the 10th. The observed range of atmospheric pressure was, therefore, no less than 2·176 inches—that is, a little less than two inches and two-tenths.

The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 42·8°, or only 0·5° below the value for November, and 6·0° below that for October, 1893. Using the formula, *Mean Temp.* = *Min.* + (*max.*—*min.* × ·52), the value was 43·7°, or 2·2° above the average mean temperature for December, calculated in the same way, in the twenty-five years 1865-89, inclusive (41·5°). The arithmetical mean of the maximal and minimal readings was 43·5°, compared with a twenty-five years' average of 41·3°. On the 15th the thermometer in the screen rose to 56·7°—wind, S.W.; on the 2nd the temperature fell to 28·3°—wind, W.N.W. The minimum on the grass was 23·0° also on the 2nd. There were only 3 days of frost in the screen and 16 days of frost on the grass.

The rainfall was 2·482 inches, distributed over as many as 19 days. The average rainfall for December in the twenty-five years, 1865-89, was 2·404 inches, and the average number of rainy days was 16·9. The rainfall, therefore, and the rainy days were above the average. In 1876 the rainfall in December was very large—7·566 inches on 22 days. In 1872, 4·932 inches fell on as many as 24 days; and in 1868 (which was otherwise a fine and dry year) 4·749 inches fell on as many as 27 days. On the other hand, in 1867, only ·771 inch was measured on 13 days; and in 1871 the December rainfall was only ·797 inch on 15 days. In 1885, only ·742 inch of rain was measured on but 10 days, but in 1886 the rainfall was 3·348 inches, distributed over as many as 21 days. In 1887 (the "dry year"), the rainfall was 1·223 inches on 19 days; in 1888, 2·911 inches on 17 days; in 1889, 1·554 inches on 15 days; in 1890, 1·856 inches on 11 days, in 1891, 3·299 inches on 21 days; and in 1892, only ·795 inch on 10 days.

Lunar halos appeared on the 14th and 18th. High winds were noted on 17 days, and attained the force of a gale on five occasions—the 6th, 8th, 10th, 15th, and the 19th. The atmosphere was more or less foggy in Dublin on the 2nd, 17th, 27th, 28th, 29th, 30th, and 31st. Neither snow nor sleet fell in Dublin, although the mountains were covered with snow on the 18th and 20th. Hail fell on the 13th. Thunder and lightning occurred on the 8th.

Cold, bright weather prevailed during the two days of the month, especially in Ireland, where an anticyclone of considerable intensity formed on Friday, the 1st, in the wake of two depressions which had passed south-eastwards across Western Europe immediately before. The frost in Scotland was very sharp on the morning of the 1st, and the wave of cold travelled southwards, so that at 8 a.m. of the 2nd the thermometer read only 17° at Loughborough.

As regards the week ended Saturday, the 9th, at first the weather was mild and damp in Ireland, rainy in Scotland, very frosty in the S. and S.E. of England. Thus at 8 a.m. of Sunday the thermometer registered 49° at Belmullet, 48° at Stornoway, in the Hebrides, where 1·2 inches of rain had fallen in the previous 24 hours; but only 21 in London. An anticyclone in which the barometer exceeded 30·5 inches, lay over the S.W. of Ireland; but a cyclonic system was skirting the north coast of Scotland. On Tuesday the barometer gave way quickly as a series of large and deep atmospheric depressions began to encroach on the shores of the North-west of Europe from the Atlantic. These, as is usual, brought unsettled weather, high but unsteady temperatures, gales and rains, to the greater part of the British Isles. On Thursday night a depression of exceptional magnitude rapidly passed northeastwards outside the north-west and north coasts of Ireland. The barometer fell to 28·27 inches at Malin Head on Friday morning, and to 27·97 inches at Stornoway at 4 p.m. of the same day. During the preceding night strong S.W. and W.S.W. gales and thunder and hail showers prevailed at many stations, and these were renewed in the course of Friday afternoon. At Navan, Co. Meath, lumps of ice fell in a thunder-shower towards evening. At night lightning was seen on the N.W. horizon from Dublin. Saturday was a bright, cold day and the week closed with a promise of frost, which, however, was not fulfilled. In Dublin the mean height of the barometer was 29·817 inches. Pressure varied from 30·393 inches at 9 a.m. of Sunday (wind, W.), to 28·937 inches at 7.30 a.m. of Friday (wind, W.S.W.). The corrected mean temperature was 44·9°. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 44·1°. On Sunday the screened thermometers sank to 33·7°, on Wednesday they rose to 53·1°. The rainfall amounted to ·352 inch on three days. The maximal fall in 24 hours was ·179 inch on Thursday. The prevalent winds were W.N.W., W., and W.S.W.

Atmospheric pressure and temperature were in a most unstable condition throughout the N. and W. of Europe and over the adjoining parts of the North Atlantic during the week ended Saturday, the 16th. Consequently, the weather was extremely unsettled, strong southerly and south-westerly gales prevailed, and heavy rainfalls occurred on all exposed coasts. On Sunday a very deep depression advanced northeastwards over Ireland. Strong S.E. to S.W. gales blew and heavy rain fell on the S. and E. coasts and over the Irish Sea during the forenoon. In Dublin the barometer fell to 28·530 inches about midday. During the next two days a number of subsidiary depressions crossed England, keeping the weather unsettled and showery. A thunderstorm occurred at Valentia Island on Monday night, and lightning was seen over the North Channel at the same time. Early on Wednesday morning a new and very deep depression was found over Central Ireland, where the barometer scarcely exceeded 28·5 inches (28·52 inches at Parsonstown, King's Co.). As pressure was at this time everywhere low, no serious gales followed, but rain fell abundantly in nearly all parts of the United Kingdom. A singularly rapid recovery of atmospheric pressure ensued, so that the Thursday morning readings exceeded those of Wednesday morning by 1·31 inches at Parsonstown, 1·29 inches in Dublin and at Valentia, and 1·22 inches at Roche's Point, Co. Cork. An anticyclone now formed over France, where temperature fell fast; but strong S.W. winds and gales, and high readings of the thermometer were reported from Ireland, Scotland, and many parts of England on both Friday and Saturday. In Dublin the mean atmospheric pressure was 29·537 inches, the barometer ranging between 28·568 inches at 9 a.m. of Wednesday (wind, S.S.W.) and 30·218 inches at 1 a.m. of Saturday (wind, S.W). The corrected mean temperature was 43·5°; the mean dry bulb readings at 9 a.m. and 9 p.m. were 43·1°. On Friday the screened thermometers rose to 56·7°, having fallen to

32·8° the previous day. The rainfall was ·862 inch on five days, ·460 inch being measured on Tuesday and ·351 inch on Sunday. The prevalent wind was S.W. Gales occurred from S.E. on Sunday, and from S.W. on Friday.

Throughout the week ended Saturday, the 23rd, atmospheric pressure remained in a very disturbed condition, rain fell frequently—in Ireland and Scotland in particular—and blustering S.W. and W. winds or gales were very prevalent, especially from Tuesday to Friday inclusive. The barometer stood highest for the most part over the Peninsula and Central Europe, lowest off our extreme W. and N.W. coasts. Hence, the winds were strong from S.W. and W. Sunday was fine, bright, and mild, but rain fell at night. Monday was colder, and snow lay on the higher ranges of the Dublin Mountains. The barometer fell fast during the ensuing night, and the wind rose to a gale from S. At 8 a.m. of Tuesday the barometer was down to 28·80 inches at Belmullet, in Mayo. In the course of Tuesday night a still deeper secondary depression advanced to St. George's Channel from the S.W., the barometer reading only 28·60 inches at Pembroke and 28·64 inches at Roche's Point at 8 a.m. of Wednesday. This low pressure system brought with it gales and heavy rains—a strong S.W. gale being felt in the S. of England and a violent N.W. gale over the western parts of the English Channel. Hail fell in the W. and N. of Ireland and thunder occurred at Ardrossan. Thursday was a fine, bright day, but on Friday forenoon another rainfall occurred in Ireland. This was followed by a beautiful day, with which the week closed. In Dublin the mean height of the barometer was only 29·562 inches, pressure ranging between 30·166 inches at 9 a.m. of Sunday (wind, S. by W.), and 28·784 inches at 9 a.m. of Wednesday (wind, N.N.E.). The corrected mean temperature was 44·0°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 43·0°. On Thursday the thermometers sank to 34·9°; on Friday they rose to 52·8°, in the screen. The prevailing direction of the wind was S.W. Rain fell on each day of the week to the total amount of ·683 inch, ·256 inch being measured on Tuesday.

The week ended Saturday, the 30th, witnessed the gradual substitution of anticyclonic for cyclonic conditions over the extreme West of Europe, and the consequent dying out of the strong, squally S.W. winds which had so long been blowing. It also saw the establishment of calms and fogs, as well as a general and decided fall of temperature towards the close of the period. At the beginning, depressions skirted the west coasts of Ireland and Scotland, and rain fell heavily in these countries and in smaller quantities over England. On Sunday a warm, bright morning was followed by a downpour of rain in Dublin, where the measurement was just half an inch. Christmas Day (Monday) was finer and cooler, but sharp showers fell shortly after midday in this city. A succession of mild dull, damp days followed, and in London dense dark fogs prevailed on Wednesday and the next two days. By Saturday, however, an anticyclone of great size and intensity had been fully established over central and western Europe and the weather brightened and became much colder. At 8 a.m. of Friday the barometer stood at 30·79 inches over the North of Germany, and the thermometer was as low as 2° F. at Munich, having fallen there 29° in the previous twenty-four hours. On Friday evening barometer rose to 30·86 inches in Berlin. Sharp frost held in Germany, France, and the centre of England on Saturday. In Dublin the mean height of the barometer was 30·319 inches, pressure ranging between 29·641 inches at 9 p.m. of Sunday (wind, W.S.W.) and 30·706 inches at 9 a.m. of Saturday (wind, S.). The corrected mean temperature was 46·4°. The mean dry bulb readings at 9 a.m. and 9 p.m. were 45·4°. On Sunday the maximum in the shade was 55·8°; on Saturday the minimum was 35·9°. Rain fell on four days to the total amount of ·585 inch; ·499 inch being measured on Sunday. The prevailing winds were southwesterly.

Sunday, the 31st, was a raw, damp, very cold day in Dublin. In the morning a dense vapour-fog prevailed, and as the thermometer stood below freezing point thick rime was deposited on trees and shrubs. On this day the distribution of both atmospheric pressure and temperature over Western Europe was peculiar. An anticyclone had its centre over the southern half of Ireland, the barometer reading 30·63 inches at 8 a.m. at Parsonstown. A deep depression was at the same moment travelling eastwards across the north of Russia, the barometer being as low as 28·60 inches at Archangel. The thermometer at the hour named read 46° at Malin Head, but only 31° at Valentia Island in Kerry and 27° at Parsonstown. Dublin was 11° colder than Holyhead. At Nairn, in the N.E. of Scotland, the temperature was 49°, in Paris it was 18°, or 31° lower. On the Christiania Fjord it was 42°, at Biarritz 28°, and at Munich 1°. Scilly was 20° warmer than London (44° compared with 42°), and Stockholm was 9° warmer than Nice (37° against 28°).

The rainfall in Dublin during the year ending December 31st amounted to only 20·493 inches on 174 days, compared with 25·644 inches on 196 days in 1892, 27·820 inches on 184 days in 1891, 27·562 inches on 200 days in 1890, 27·272 inches on 193 days in 1889, 28·679 inches on 190 days in 1888, 16·601 inches on 160 days in 1887, and a 25 years' average of 27·696 inches on 194·3 days.

At Knockdolian, Greystones, Co. Wicklow, the rainfall in December, 1893, was 2·940 inches, distributed over 20 days. Of this quantity ·540 inch fell on the 12th and ·420 inch on the 20th.

From January 1st to December 31st, 1893, rain fell at Knockdolian, Greystones, on 170 days, and to the total amount of 22·526 inches.

At Cloneevin, Killiney, Co. Dublin, 2·04 inches of rain fell during December on 20 days. The maximal fall in 24 hours being ·29 inch on the 19th. The average rainfall for December at this station is 2·117 inches on 15 days.

From January 1st to December 31st, 1893, rain fell at Cloneevin, Killiney, on 176 days to the total amount of 18·05 inches.

For Remarks on the Rainfall in 1893 *and Abstracts of Meteorological Observations*, 1873–93, *see pages* 184–8.

MARRIAGES, BIRTHS, and DEATHS *registered* in the Year 1893.

I.—PROVINCE OF LEINSTER.—MARRIAGES, BIRTHS, AND DEATHS, 1893.

SUPERINTENDENT REGISTRARS' DISTRICTS, ARRANGED BY COUNTIES.*

Wherever the minus sign (—) is prefixed to the number given in the column headed "Excess of Births over Deaths," it denotes that the births, instead o exceeding the deaths, were, in fact, *less than the Deaths* to the extent stated.

No.	SUPERINTENDENT REGISTRARS' DISTRICTS.	AREA in Statute Acres.	Population, 1891.	TOTAL: MARRIAGES.	TOTAL: BIRTHS.	TOTAL: DEATHS.	BIRTHS. Including Illegitimate Births. Males.	BIRTHS. Including Illegitimate Births. Females.	BIRTHS. Illegitimate Births. Males.	BIRTHS. Illegitimate Births. Females.	DEATHS. Males.	DEATHS. Females.	Excess of Births over Deaths.

Note.—The Registrars' Districts are subdivisions of the Unions or Superintendent Registrars' Districts, and are identical with the Dispensary Districts of the same names, except in a few instances.

The letter *W.* denotes that the Registrar's District contains within its limits the Workhouse belonging to the Union or Superintendent Registrar's District.

Wherever the minus sign (—) is prefixed to the numbers given in the column headed "Excess of Births over Deaths," it denotes that the births, instead of exceeding the deaths, were, in fact, *less than the deaths* to the extent stated.

* On the 1st July, 1893, the Registrars' Districts of Belfast Nos. 3, 9, and 10 were sub-divided, and the boundaries thereof altered so as to form four Registrars' Districts, styled Belfast Nos. 3, 9, 10, and 11 respectively, and on the same day the Registrar's District of Castlereagh No. 1 (see page 88) was sub-divided into the Districts of Castlereagh Nos. 1 and 4. The numbers of Births and Deaths given in this Abstract for the Districts of Belfast No. 11 and Castlereagh No. 4 are those for the second half of the year only, and those entered for Belfast Nos. 3, 9, and 10, and Castlereagh No. 1, include all the Births and Deaths registered during the first half of the year in those Districts as then constituted.

The rainfall was 7·203 inches in defect of the average annual measurement of the twenty-five years, 1865–89, inclusive—viz., 27·696 inches.

It will be remembered that the rainfall in 1887 was very exceptionally small—16·601 inches, the only approach to this measurement in Dublin being in 1870, when only 20·859 inches fell, in 1884, when the measurement was 20·467 inches, and in 1893 with its rainfall of 20·493 inches. In seven of the twenty-five years in question the rainfall was less than 26 inches, and in 1885 it was 26·614 inches.

The scanty rainfall in 1887 was in marked contrast to the abundant downpour in 1886, when 32·966 inches—or as nearly as possible double the fall of 1887—fell on 220 days. Only twice since these records commenced has the rainfall in Dublin exceeded that of 1886—namely, in 1872, when 35·566 inches fell on 238 days, and in 1880, when 34·512 inches were measured on, however, only 188 days.

In 1893, there were 174 rainy days, or days upon which not less than ·01 inch of rain (one hundredth of an inch) was measured. This was considerably in defect of the average number of rainy days, which was 194·3 in the twenty-five years, 1865–89, inclusive. In 1868—the warm dry year of recent times—as well as in 1887, the rainy days were only 160, and in 1870 they were only 145. In 1868, however, the rainfall amounted to 24·935 inches, or more than 8 inches above the measurement in 1887, and even in 1870, 20·859 inches were recorded.

The rainfall in 24 hours from 9 a.m. to 9 a.m. exceeded one inch on two occasions in 1892—viz., May 28th (2·056 inches), and August 16th (1·310 inches). On no occasion in 1893 did one inch of rain fall on a given day in Dublin, the maximal daily measurements were ·871 inch on July 12th, and ·821 inch on November 16th.

Included in the 174 rainy days in 1893 are 17 on which snow or sleet fell, and 21 on which there was hail. In January hail was observed on 4 days, in February on 6 days, in March on 2 days, in April, August, and October on 1 day, in November on 5 days, and on one day in December. Snow or sleet fell on 4 days in January, on 7 days in February, on 2 days in March, on 4 days in November, and on not one occasion in December. Thunder occurred on ten occasions during the year—three times in May, twice in July and August, and once in June, September, and December. Lightning was also seen on four occasions in October, twice in August and September, and once in February and December.

The rainfall was distributed as follows:—5·196 inches fell on 49 days in the first quarter, 4·428 inches on 29 days in the second, 5·484 inches on 44 days in the third, and 5·385 inches on 52 days in the fourth and last quarter.

The rainfall in the first six months was 9·624 inches, on 78 days—that is, not one-half of the year's record. In February the rainfall was 2·669 inches on 22 days, in August 2·713 inches fell on 16 days, and in December 2·482 inches on 19 days.

Of the 5·385 inches which fell in the fourth quarter of the year, only 1·033 inches were measured in October on 16 days, and 1·870 inches in November on 17 days. In December the rainfall was both considerable and frequent.

Aurora borealis was observed on three occasions—namely, on February 16th, September 1st, and October 29th. More or less fog prevailed on 38 occasions—4 in January, 3 in February, 8 in March, 2 in April, 3 in August, September, and October, respectively; 5 in November, and 7 in December. The March fogs were very dry. High winds were noted on 130 days—18 in January, 11 in February and March, respectively; 4 in April and May, respectively; 7 in June, 9 in July, 10 in August, 14 in September, 10 in October, 15 in November, and 17 in December. The high winds amounted to gales (force 7 or upwards according to the Beaufort scale) on 24 occasions—4 in January and February, respectively; 1 in March and June, respectively; 3 in August, 2 in October, 4 in November, and 5 in December.

Rainfall at Killiney, Co. Dublin, in 1893.

Mr. Robert O'Brien Furlong, M.A., Univ. Dubl., reports that rain fell in 1893, at his residence, Cloneevin, Killiney, Co. Dublin, on 176 days to the total amount of 18·05 inches. The average figures for eight years were 25·518 inches on 174·35 days. In 1887—the Jubilee year—the rainfall at this station was only 17·64 inches on but 148 days. In that year 1·05 inches fell on one day. The maximal fall on any one day in 1893 was only ·63 inch on April 16. Periods of absolute drought—14 days without rain—occurred from April 1 to 14 and from June 7 to 21. From March 19 to April 14 only ·02 inch fell.

ABSTRACT OF METEOROLOGICAL OBSERVATIONS taken at 40 Fitzwilliam-square, West, Dublin, during the Year 1893, by J. W. MOORE, Esq., M.D., UNIV. DUB., F.R.C.P.I., F.R. MET. SOC.

NOTE.—The mean pressures shown in the above Table have been given corrected for instrumental error and reduced to 32° Fahrenheit, but not reduced to mean sea level. If it be desired for any purpose to reduce them to the normal, the approximate correction for the purpose (varying within slight limits with the pressure and the temperature) is:—+ ·058.

NOTE.—This table has been constructed for the years 1801 to 1831—By adopting the rates of increase of the male and female population between 1821 and 1831, as shown by the Irish Census Reports of 1831—the first complete Census of Ireland having been taken in 1821.

1832 to 1841—By adopting the rate of increase between the population of 1831 and 1841, according to the Irish Census Report of 1841.

1842 to 1846—By taking the English average birth-rate of 1 in 31, and death-rate of 1 in 45, and deducting the annual emigration from Ireland according to the returns received from the Emigration Commissioners in England.

1847 to 1851—The English birth-rate, as above, was used, deducting the number of deaths and the number of emigrants in each year, as given in the Irish Census Reports of 1851; an allowance, proportioned to the number of recorded deaths and the number of emigrants being made in each year for the excess of the number thus arrived at for 1851 over the actual population according to the Census of that year.

1852 to 1871—The English birth and death rates, as above, were used, deducting the number of emigrants according to the returns obtained by the Registrar-General for Ireland, and allowing for excess over Census numbers for 1861 and 1871 as explained for the last period.

1872–93—By adding the Births registered in each year to the estimated population for the previous year, deducting the deaths and the number of emigrants, and adjusting the results for the years 1872–81 and 1882–91 to allow for the discrepancy between the number thus arrived at for 1881 and 1891 respectively, and the population as shown by the Census in each of these years.

AGES of the POPULATION in IRELAND according to the Census Returns of 1861, 1871, 1881, and 1891.

Periods.	Sexes.	Ages—Years. Under 1.	1 and under 5.	5 and under 10.	10 and under 15.	15 and under 20.	20 and under 25.	25 and under 35.	35 and under 45.	45 and under 55.	55 and under 65.	65 and under 75.	75 and under 85.	85 and under 95.	95 and upwards.	Total.

* Thus, the number of Marriages in the Abbeyleix Superintendent Registrar's District may at once be ascertained by referring in the "*Abstract of Marriages*" to the Superintendent Registrar's District, numbered 45 (*see* page 50), and in like manner the number of Births and Deaths, of Deaths at different ages, &c., will be found by referring to the same Superintendent Registrar's District Number in the appropriate Tables.

INDEX TO REGISTRARS' DISTRICTS.

[The Number or Numbers against each Registrar's District in the Third Column refers to the page or pages in which the Total Births, Illegitimate Births, Deaths, &c., in the District during the year are given.]

REPORT on the ADMINISTRATION of the LEGAL WORK of the GENERAL REGISTER OFFICE, DUBLIN, for the Financial Year 1893–94.

SIR,—I beg to report that the legal work of your Department during the year 1893–94 was administered as follows:—

Inclusive of a large number of cases, in which it was found that no proceedings could be taken against the responsible parties, as the legal time for doing so had elapsed, 670 offences against the Registration Acts were reported by Local Officers, and came under investigation in this Department during the year. In many of these the defaulters came forward and complied with the requirements of the law, on becoming aware that proceedings against them were in contemplation.

After careful inquiry into the circumstances and examination of the evidence available, in 190 cases prosecutions were directed against the offenders. In 103 of these the parties were convicted and punished; in 81 cases the proceedings were abandoned, the parties (in most cases) paying the costs of court and complying with the law, and in 6 cases the summonses were dismissed.

The cases dealt with included the following offences:—Neglect to register births; neglect to register deaths; neglect to furnish certificates of marriage; failure of Coroner to furnish certificate of inquest; giving false information as to age at death, as to the cause of death, and as to duration of illness previous to death; giving false information as to births, viz., registering illegitimate children as legitimate, and misrepresenting date of birth; neglect of Medical Practitioner to furnish certificate of cause of death; neglect of Registrar to furnish certified copies of entries in his Register Books; burying two bodies in one coffin without due notice.

The following are the details in a few of these cases:—

J. A. O'F., a Medical Practitioner, was prosecuted for neglecting to give to the informant a medical certificate of the cause of death. He was convicted and fined 10*s.* and £1 costs.

M. R. was prosecuted at Markethill Petty Sessions for falsely stating, when registering a death, that he was present thereat, and for wilfully understating the age for fraudulent purposes in connection with an insurance on the life of deceased. He was convicted, and fined 40*s.* and 20*s.* costs, or one month's imprisonment with hard labour.

A. J. was prosecuted at Donemana Petty Sessions for neglecting to register the birth of his child. He was convicted and fined £1, including costs.

J. B. was prosecuted at Garvagh Petty Sessions for making a false declaration with the view of having an illegitimate birth registered as legitimate. He was convicted and fined £2 10*s.* and £1 costs.

T. F., an undertaker, was prosecuted for burying the bodies of a mother and her stillborn child in the same coffin, without giving due notice in writing as required by the Registration Act, 1880. He was convicted and fined 5*s.* and £1 costs.

L. P. was prosecuted at Tinahely Petty Sessions for giving false information when registering the death of his father, by wilfully understating the age for fraudulent purposes in connection with insurance. He was convicted, and fined 30*s.* and costs or one month's imprisonment.

J. M. was prosecuted at Moira Petty Sessions for neglecting to register a death. He was convicted and fined 10*s.* and costs.

B. A. McG., a Registrar, was prosecuted for neglecting to duly furnish certified copies of the entries in his Register Books. The defendant had to pay costs amounting to £2 10*s.* 4*d.*

B. G. was prosecuted at Arklow Petty Sessions for giving false information when registering a death, by wilfully understating the age, for fraudulent purposes connected with insurance. She was convicted and fined £1 1*s.*

M. McN. was prosecuted at the Belfast Police Court for registering an illegitimate birth as legitimate. She was convicted and fined £1 with 12*s.* 6*d.* costs.

J. McC. was prosecuted at the Metropolitan Police Courts for burying the bodies of two of his children in one coffin, without giving due notice thereof in writing. He was convicted and fined 10*s.*

Notwithstanding the vigorous measures adopted by the Department for the punishment of offenders, several Registrars report that they believe false information is frequently given to them, especially in cases of deaths.

The *modus operandi* in one class of offences appears to be as follows: when a member of a family is entered in a Friendly Society or Industrial Assurance Company, the age is frequently given as much below the real age in order to reduce the amount of the premium payable. After a time the person dies, and then the registry is effected so as to suit the statements previously made to the Society or Company.

It sometimes happens, however, that the informant overlooks the fact that the age in the register is to correspond with the age in the policy, and, in order to obtain the money, another nefarious proceeding is then necessary, viz., the making a declaration before a magistrate, altering the age correctly given in the register to an incorrect age, to agree with the age in the policy.

The greatest pains have been taken to obtain evidence in these cases to convict the offenders, but in many of them, I regret to state, for want of documentary proof of age, the case had to be abandoned, though no reasonable doubt existed that the offence had been committed.

The absence of reliable records of birth or baptism in the case of old persons, makes it exceedingly difficult to deal with them. In several cases the age of a deceased person has been successfully proved from a marriage register, giving the age at time of marriage, and in other cases the age inserted or proposed to be inserted in the register has been proved to be impossible from the records of the births or baptisms of the children of the deceased.

The Department is greatly indebted to the Inspector-General of the Royal Irish Constabulary and the Commissioner of Metropolitan Police for their kind assistance in investigating these numerous and varied criminal cases.

In addition to the above mentioned, there were a number of cases during the year in which proceedings were taken under the 26 & 27 Vic., cap. 90, before the magistrates at Petty Sessions for corrections in marriage registers, the summonses in these cases being issued at the instance of local Registration Officers.

A sum of £130 was provided in the estimate to meet legal charges. The total cost of the legal service of the Department during the year was £93 15*s.* 1*d.*, of which sum £56 16*s.* 10*d.* was paid for local professional assistance and £23 2*s.* for mileage to the Registrars.

I am, Sir,

Your obedient servant,

R. E. Matheson,
Barrister-at-Law.

Thomas W. Grimshaw, Esq., M.D.,
Registrar-General.

W

DUBLIN CASTLE,

6th October, 1894.

SIR,

I have to acknowledge the receipt of your letter of the 5th instant, forwarding, for submission to His Excellency the Lord Lieutenant, copy of your Annual Report on Marriages, Births, and Deaths registered in Ireland in the year 1893.

I am,

Sir,

Your obedient Servant,

W. S. B. KAYE

The Registrar-General,

Charlemont House,

Rutland Square.
